Nursing Care of the Pediatric Neurosurgery Patient is a detailed

reference for nurses and other health care providers who care for children with neurosurgical problems. The explanations of pathophysiology, anatomy, radiodiagnostic testing, and treatment options for each neurosurgical diagnosis will help to clarify the rationale behind the nursing care. Descriptions of presenting symptoms, history and findings on neurological examination will help nurses understand the neurological disorder and identify problems. Each chapter includes case studies, impact on families,

patient and family education, and practice pearls. Staff and student nurses working in clinics, critical care units, pediatric units, operating rooms, post-anesthesia care units, emergency departments, and radiology departments will benefit from the information presented. Although this book is written for nurses, medical students and neurosurgery residents will also find it helpful.

This book is based on an extensive filmed conversation between Howard Burton and Diana Deutsch, Professor of Psychology at UC San Diego and one of the world's leading experts on the psychology of music. This conversation provides behind the scenes insights into her discovery of a large number of auditory illusions, including the so-called Octave Illusion, which concretely illustrate how what we think we're hearing is often quite different from the actual sounds that are hitting our eardrums. This carefully-edited book includes an introduction, Revealing Mistakes, and questions for discussion at the end of each chapter: I. Eclectic Beginnings - Music, art, philosophy, and philosophical psychology II. Tones, Pitches and Critical Values - Intriguing results in music and memory III. The Octave Illusion - How to confuse the brain with tones IV. Medical Applications - A highly suggestive result for epilepsy patients V. Eyes vs. Ears - The neurophysiological differences between vision and hearing VI. Gut Issues - The impact of discomfort VII. The Scale Illusion - Auditory scene analysis and evolutionary factors VIII. Surrounded by Illusions - From the Glissando Illusion to Tchaikovsky's 6th IX.

Perfect Pitch & Tone Languages - Why Mandarin might help your musicianship X. Towards Monotony? - The tonal implications of globalization XI. Embracing Discomfort - The benefits of being confused About Ideas Roadshow Conversations Series This book is part of an expanding series of 100+ Ideas Roadshow conversations, each one presenting a wealth of candid insights from a leading expert in a relaxed and informal setting to give non-specialists a uniquely accessible window into frontline research and scholarship that wouldn't otherwise be encountered through standard lectures and textbooks. Some may say that this book is long overdue; others, including myself, will state that the book appears at just the right time. The latter is likely more true, for it is doubtful that many in the professions would, until now, link issues of learning disabilities with those of neurophysiological dysfunction in the manner in which ultimately must be the case. As a matter of fact, there are those who deny the relationship completely. Lee Wiederholt (1974)¹ in his short, but excellent, review of the historical perspectives of learning disabilities, traces the early interest in this problem to the work of Gall (1802), and to his successors Broca (1861), Jackson (1864), Bastian (1869), and a few others. Each of these men would, at the time of this writing, be considered to have interests in the field of neurology, although at the time of their investigations, neurology per se was but a gleam in the eye of the anatomical beholder. A relative detour then took place. Cerebral palsy, in the decades of the 1940s and 1950s, caught the attention of researchers through the work of Winthrop

Morgan Phelps (orthopedist) and George Deaver (physiatrist) and one or two other medically oriented individuals. This was related to the writings of W. J. Little (1810-1894). It was, however, Kurt Goldstein, Heinz Wemer, both eminent German scientists, and Alfred A.

Since Dr. Brizendine wrote *The Female Brain* ten years ago, the response has been overwhelming. This New York Times bestseller has been translated into more than thirty languages, has sold nearly a million copies between editions, and has most recently inspired a romantic comedy starring Whitney Cummings and Sofia Vergara. And its profound scientific understanding of the nature and experience of the female brain continues to guide women as they pass through life stages, to help men better understand the girls and women in their lives, and to illuminate the delicate emotional machinery of a love relationship. Why are women more verbal than men? Why do women remember details of fights that men can't remember at all? Why do women tend to form deeper bonds with their female friends than men do with their male counterparts? These and other questions have stumped both sexes throughout the ages. Now, pioneering neuropsychiatrist Louann Brizendine, M.D., brings together the latest findings to show how the unique structure of the female brain determines how women think, what they value, how they communicate, and who they love. While doing research as a medical student at Yale and then as a resident and faculty member at Harvard, Louann Brizendine discovered that almost all of the clinical data in existence on neurology, psychology, and neurobiology focused exclusively on males. In response to the overwhelming need for information on the female mind, Brizendine established the first clinic in the country to study and treat women's brain function. In *The Female Brain*, Dr. Brizendine distills all her findings and the latest information from the scientific community in a highly accessible book that educates women about their unique brain/body/behavior. The result: women will come away from this book knowing that they have a lean, mean, communicating machine. Men will develop a serious case of brain envy.

All about diagnostic and prognostic tools available as well as epilepsy surgery. Patients with refractory extratemporal lobe

epilepsy, particularly those in whom imaging examinations did not reveal any brain lesions, have a less positive prognosis after surgery than those with mesial temporal lobe epilepsy. The semiology of seizures, the functional imaging techniques, neuropsychological evaluation and intracranial EEG are used to select surgical patients. Moreover, a large number of centres have experimented with new methods for identifying the epileptogenic area in these patients. Written by international experts who attended the Cleveland colloquium, it will be all the more useful to neurologists, neurosurgeons and epileptologists as no other work until now has focused on this subject. Contents : Section I - Semiology of extratemporal lobe epilepsy Section II - Non-invasive neurophysiology of extratemporal lobe epilepsies Section III - Neuroimaging of extratemporal lobe epilepsies Section IV - Invasive evaluation of extratemporal lobe epilepsies Section V - Surgery and outcome of extratemporal lobe epilepsies *The Brain That Changes Itself* American Chemical Society In a book perfect for readers of Charles Duhigg's *The Power of Habit*, David Eagleman's *Incognito*, and Leonard Mlodinow's *Subliminal*, the cognitive neuroscientists who discovered how the brain has aha moments—sudden creative insights—explain how they happen, when we need them, and how we can have more of them to enrich our lives and empower personal and professional success. Eureka or aha moments are sudden realizations that expand our understanding of the world and ourselves, conferring both personal growth and practical advantage. Such creative insights, as psychological scientists call them, were what conveyed an important discovery in the science of genetics to Nobel laureate Barbara McClintock, the melody of a Beatles ballad to Paul McCartney, and an understanding of the cause of human suffering to the Buddha. But these moments of clarity are not given only to the famous. Anyone can have them. In *The Eureka Factor*, John Kounios and Mark Beeman explain how insights arise and what the scientific research says about stimulating more of them. They discuss how various conditions affect the likelihood of your having an insight, when insight is helpful and when deliberate methodical thought is better suited to a task, what the relationship is between insight and intuition, and how the brain's right hemisphere contributes to creative thought. Written in a lively, engaging style, this book goes beyond scientific principles to offer productive techniques for realizing your creative

potential—at home and at work. The authors provide compelling anecdotes to illustrate how eureka experiences can be a key factor in your life. Attend a dinner party with Christopher Columbus to learn why we need insights. Go to a baseball game with the director of a classic Disney Pixar movie to learn about one important type of aha moment. Observe the behind-the-scenes arrangements for an Elvis Presley concert to learn why the timing of insights is crucial. Accessible and compelling, *The Eureka Factor* is a fascinating look at the human brain and its seemingly infinite capacity to surprise us. Praise for *The Eureka Factor* “Delicious . . . In *The Eureka Factor*, neuroscientists John Kounios and Mark Beeman give many other examples of [a] kind of lightning bolt of insight, but back this up with the latest brain-imaging research.”—*Newsweek* “An incredible accomplishment . . . [The *Eureka Factor*] is not just a chronicle of the journey that numerous scientists (including the authors) have taken to examine insight but is also a fascinating guide to how advances in science are made in general. Messrs. Kounios and Beeman examine how a parade of clever experiments can be designed to answer specific questions and rule out alternative possibilities. . . . Wonderful ideas appear as if out of nowhere—and we are delighted.”—*The Wall Street Journal* “An excellent title for those interested in neuroscience or creativity . . . The writing is engaging and readable, mixing stories of famous perceptions with explanations of how such revelations happen.”—*Library Journal* (starred review) “A lively and accessible ‘brain’ book with wide appeal.”—*Booklist* “[An] ingenious, thoughtful update on how the mind works.”—*Kirkus Reviews* “The *Eureka Factor* presents a fascinating and illuminating account of the creative process and how to foster it.”—James J. Heckman, Nobel laureate in economics

This is a practical book on MEG that covers a wide range of topics. The book begins with a series of reviews on the use of MEG for clinical applications, the study of cognitive functions in various diseases, and one chapter focusing specifically on studies of memory with MEG. There are sections with chapters that describe source localization issues, the use of beamformers and dipole source methods, as well as phase-based analyses, and a step-by-step guide to using dipoles for epilepsy spike analyses. The book ends with a section describing new innovations in MEG systems, namely an on-line real-time MEG data acquisition system, novel applications for MEG research, and a proposal for a helium recirculation system. With such breadth of topics, there will be a chapter that is of interest to every MEG researcher or clinician.

THE DIFFERENCE IN THE PREFERRED LEARNING STYLES BETWEEN RIGHT BRAIN DOMINANT AND LEFT BRAIN

DOMINANT STUDENTS

Juta and Company Ltd

A new edition of the bestselling classic – published with a special introduction to mark its 10th anniversary This pioneering account sets out to understand the structure of the human brain – the place where mind meets matter. Until recently, the left hemisphere of our brain has been seen as the ‘rational’ side, the superior partner to the right. But is this distinction true? Drawing on a vast body of experimental research, Iain McGilchrist argues while our left brain makes for a wonderful servant, it is a very poor master. As he shows, it is the right side which is the more reliable and insightful. Without it, our world would be mechanistic – stripped of depth, colour and value.

This book has brought together leading investigators who work in the new arena of brain connectomics. This includes ‘macro-connectome’ efforts to comprehensively chart long-distance pathways and functional networks; ‘micro-connectome’ efforts to identify every neuron, axon, dendrite, synapse, and glial process within restricted brain regions; and ‘meso-connectome’ efforts to systematically map both local and long-distance connections using anatomical tracers. This book highlights cutting-edge methods that can accelerate progress in elucidating static ‘hard-wired’ circuits of the brain as well as dynamic interactions that are vital for brain function. The power of connectomic approaches in characterizing abnormal circuits in the many brain disorders that afflict humankind is considered. Experts in computational neuroscience and network theory provide perspectives needed for synthesizing across different scales in space and time. Altogether, this book provides an integrated view of the challenges and opportunities in deciphering brain circuits in health and disease.
