A typical layout is shown in Figure 4.8. In this case the central point is also a transformer substation, where the voltage is stepped up again to high voltage (HV, typically 100 to 150 kV) for connection to the existing

electricity network. Electrical works - Wind Energy A wind farm or wind park, also called a wind power station or wind power plant, is a group of wind turbines in the same location used to produce electricity. Wind farms vary in size from a small number of turbines to several hundred wind turbines covering an extensive area. Wind farms can be either onshore or offshore. Wind farm - Wikipedia WT convert wind energy into electrical energy, which is fed into electricity supply systems. The connection of WT to the supply systems is possible to the low voltage, medium voltage, high voltage as well as to the extra high voltage system. Wind turbine grid connection and interaction 1.1 Design objective Electrical design of a wind farm concerns all electrical components and how these are put together in a suitable grid structure. The overarching goal is to design an electrical system that ensures that as much as possible of the available wind power is transferred to the transmission system with as small as possible costs. Design procedure for interarray electric system (D2.2) There are several factors that have an impact on the performance of the wind farm, mainly

energy production of wind farm which is highly decided by the wind condition of construction area and micro-siting of wind turbines (WTs), as well as initial investment which is influenced by both the placement of WT's and the electrical system design, especially the scheme of cable connection layout. A review of offshore wind farm layout optimization and ... Wind farm electrical system design presents some unique grounding considerations not always associated with other types of electrical power systems. The three major grounding design areas include the wind turbine-generators (WTG's), the collector cable system, and the utility interconnect substation. Figure 1 from Considerations in wind farm grounding design ... Another important aspect of wind farm design is the cabling layout between the individual turbines and the wind farm substation. Meanwhile specialized wind turbine transformers are now being made available to replace less reliable off-the-shelf units. Wind Farms - an overview | ScienceDirect Topics • Wind farm collector system • Inter-turbine Medium Voltage (MV) AC cables (typically 34.5 kV) • Substation platform with

transformer and electrical equipment • Converter platform if High Voltage (HV) DC transmission is used The MV electrical network takes the power to a central point (or several points, for a large wind farm). A typical layout is shown in Figure 4.8. In this case the central point is also a transformer substation, where the voltage is stepped up again to high voltage (HV, typically 100 to 150 kV) for connection to the existing electricity network.
