This book offers an essential guide to RNA activation (RNAa), an emerging and fascinating new field. RNAa is a small RNA-guided and Argonaute-dependent gene regulation phenomenon in which promoter-targeted short double-stranded RNAs (dsRNAs) induce target gene expression at the transcriptional level. It occurs primarily in the nucleus and can be mediated by artificially designed short duplex RNAs that target regulatory sequences (e.g., promoters, genes' 3' termini and enhancers) and naturally occurring small RNAs (e.g., miRNAs and *C. elegans* 22G-RNAs). With contributions from internationally respected RNA experts, this book provides comprehensive coverage of different RNAa mechanisms and a timely update on recent advances in RNAa research, with a focus on developing RNAa-based therapeutics. Special chapters are also devoted to the topics of gene activation induced by antisense oligonucleotides and the CRISPR system. As

the first book to cover RNAa, it will be of interest to a wide audience, from scientists in academia and the pharmaceutical industry to clinicians who wish to further explore the biology of RNAa and related phenomena, so as to harness their full potential for use in biotechnology and drug development.

RNA functions broadly as informational molecule, genome, enzyme and machinery for RNA processing. While these functions reflect ancient activities, they also remain vital components of contemporary biochemical pathways. In eukaryotic cells RNA processing impacts the biogenesis of RNA molecules of essentially every shape and function. The collection of articles in this volume describes the current state of understanding of the broad array of RNA processing events in animal and plant cells, key unanswered questions, and cutting edge approaches available to address these questions. Some questions discussed in this volume include, how viruses subvert the RNA processing machinery of the host cell, how the coordination of co-transcriptional RNA processing is regulated at the level of chromatin, the status of RNA processing in plant organelles, and how micro RNA machinery is biosynthesized and regulated.

RNAs form complexes with proteins and other RNAs. The RNA-infrastructure represents the spatiotemporal interaction of these proteins and RNAs in a cell-wide network. RNA Infrastructure and Networks brings together these ideas to illustrate the scope of RNA-based biology, and how connecting RNA mechanisms is a powerful tool to investigate regulatory pathways. This book is but a taste of the wide range of RNA-based mechanisms that connect in the RNA infrastructure.

The development of the germline in *Caenorhabditis elegans* is a complex process involving the regulation of thousands of genes in a coordinated manner. These genes must direct the regulation of cell proliferation, meiosis, and sex determination, as well as gamete formation and fertilization. Several genes required for small RNA biogenesis and function are also required for the proper organization and development of the germline. EGO-1 is a

putative RNA-directed RNA polymerase (RdRP) that is required for *C. elegans* germ-line development and efficient RNAi of germ-line expressed genes. Additionally, ego-1 mutants have been shown to exhibit defects in heterochromatin assembly on unpaired DNA and proper chromosome segregation during meiosis. Despite our understanding of the morphology of ego-1 mutant worms, it has remained unclear how the loss of a putative RdRP can cause such dramatic phenotypes in the *C. elegans* germline. That is, what role does EGO-1 play in promoting the development of the germline? There is strong evidence for the requirement of the *C. elegans* RdRP RRF-3 in producing endogenous small RNAs that target mRNA produced from specific genes. Additionally, there is evidence that EGO-1 may interact directly with chromatin. The questions become what target (or perhaps targets) is being disrupted in the ego-1 mutant and are they being disrupted at the chromatin or RNA level? Using high-throughput small RNA and messenger RNA sequencing we found that EGO-1 is required to produce small RNAs antisense to a number of germline-expressed genes through several developmental stages. We found that these genes fall into several classes including genes required for kinetochore (klp-7) and nuclear pore (npp-3) assembly, as well as the production of histone-modifying (set-21) and centromeric proteins (hcp-3). We also found several RNAi-related genes to be targets of EGO-1 (csr-1, mut-14, mut-16, prg-1, tsn-1). Finally, we show a strong correlation between the loss of small RNAs and the rise of mRNA levels in ego-1(-) animals.

RNA and Protein Synthesis is a compendium of articles dealing with the assay, characterization, isolation, or purification of various organelles, enzymes, nucleic acids, translational factors, and other components or reactions involved in protein synthesis. One paper describes the preparatory scale methods for the reversed-phase chromatography systems for transfer ribonucleic acids. Another paper discusses the determination of adenosine- and aminoacyl adenosine-terminated sRNA chains by ion-exclusion chromatography. One paper notes that the problems involved in preparing acetylaminoacyl-tRNA are similar to those found in peptidyl-tRNA synthesis, in particular, to the lability of the ester bond between the amino acid and the tRNA. Another paper explains a new method that will attach fluorescent dyes to cytidine residues in tRNA; it also notes the possible use of N-hydroxysuccinimide esters of dansylglycine and N-methylantranilic acid in the described method. One paper explains the use of membrane filtration in the determination of apparent association constants for ribosomal protein-RNS complex formation. This collection is valuable to bio-chemists, cellular biologists, micro-biologists, developmental biologists, and investigators working with enzymes.

In this book, the author Joseph G. Sinkovics liberally shares his views on the cancer cell which he has been observing in vivo and

in vitro, over a life time. Readers will learn how, as an inherent faculty of the RNA/DNA complex, the primordial cell survival pathways are endogenously reactivated in an amplified or constitutive manner in the multicellular host, and are either masquerading as self-elements or as placentas, to which the multicellular host is evolutionarily trained to extend full support. The host obliges. The author explains that there is no such evidence that “malignantly transformed” human cells survive in nature. However, when cared for in the laboratory, these cells live and replicate as immortalized cultures. These cells retain their vitality upon storage in liquid nitrogen. One can only imagine an astrophysical environment in which such cells could survive; perhaps, first their seemingly humble exosomes would populate that environment. Immortal cell populations so created may survive as individuals, or may even re-organize themselves into multicellular colonies, as representatives of life for the duration of the Universe. This thought-provoking book is the work of a disciplined investigator and clinician with an impeccable reputation, and he enters a territory that very few if any before him have approached from the same angles. It will appeal to researchers with an interest in cell survival pathways and those researching cancer cells.

Transfer RNA in Protein Synthesis is a comprehensive volume focusing on important aspects of codon usage, selection, and discrimination in the genetic code. The many different functions of tRNA and the specialized roles of the corresponding codewords in protein synthesis from initiation through termination are thoroughly discussed. Variations that occur in the initiation process, in reading the genetic code, and in the selection of codons are discussed in detail. The book also examines the role of modified nucleosides in tRNA interactions, tRNA discrimination in aminoacylation, codon discrimination in translation, and selective use of termination codons. Other topics covered include the adaptation of the tRNA population to codon usage in cells and cellular organelles, the occurrence of UGA as a codon for selenocysteine in the universal genetic code, new insights into translational context effects and in codon bias, and the molecular biology of tRNA in retroviruses. The contributions of outstanding molecular biologists engaged in tRNA research and prominent investigators from other scientific disciplines, specifically retroviral research, make Transfer RNA in Protein Synthesis an essential reference work for microbiologists, biochemists, molecular biologists, geneticists, and other researchers involved in protein synthesis research.
