"Electricity has become not only an essential element to people's everyday life but also the most important power source to most industries and businesses. The continuously increasing demand of electricity consumption has resulted in a consistent expansion of power grid as it was seen in the past few decades. This in turn has dramatically increased the cost of electricity during the same period in Australia. In contrast, the recently recorded low economic activities and significant growth of rooftop photovoltaic has led to a reduction in the forecasted electricity demand in Australia. This has resulted a reduced number of network augmentation projects for most electric utilities across the country. Instead, the substation refurbishment work has become the focus for most electric

utilities in the foreseeable future. Such sharp turning point of trend has placed an enormous challenge in front of electric utilities on how to make the power system operation more cost effective and preserve a high level of reliability and security. In response to the challenge, the integration of advanced technologies with the existing power system has been recognised as a viable solution. The international standard IEC 61850 for substation communication system has gained momentum globally to be implemented in power utility automation systems. The flexibility and vendor independent feature of the standard inspired a range of innovative approaches for power grid projects including substation refurbishment work. This research aims to develop and verify a vendor independent device, which is named as substation event monitor, with the capability of interfacing the legacy and existing substation automation system equipment to the modern intelligent electronic devices (IEDs) over Ethernet network in a non-intrusive and cost effective manner. The substation event monitor is also equipped with the ability of providing synchronised time information at the accuracy level of  $\pm 1$  microsecond over the same communication infrastructure via IEEE 1588 standard, also called the Precision Time Protocol (PTP). The created device is suitable for substation refurbishment work and has the potential in many other utility applications, such as network state estimation and substation commissioning. This thesis takes a bottom-up approach to the form of information on the construction and verification of substation event monitor. It begins with the provision of the critical review on the detailed knowledge of

both international standards of IEC 61850 and IEEE 1588. This work was needed because there is lack of concise, publicly available and informative material on these complex standards for power utility engineers. The thesis is then expanded with the in-depth design information on the developed prototype of substation event monitor. Finally, the verification results of the prototype device were produced at both component level and system level in this thesis. The provision of the comprehensive knowledge of the prototype device will deliver confidence to utility engineers in considering the adoption of substation event monitor as a low cost, non-intrusive, IEC 61850 compatible and synchronised IED that meets the needs of substation refurbishment work and other potential power utility applications." -- abstract, pages ii-iii.

Motivation for This Book The OPC Foundation provides specifications for data exchange in industrial au- mation. There is a long history of COM/DCOM-based specifications, most pro- nent OPC Data Access (DA), OPC Alarms and Events (A&E), and OPC Historical Data

Access (HDA), which are widely accepted in the industry and implemented by almost every system targeting industrial automation. Now the OPC Foundation has released a new generation of OPC specifications called OPC Unified Architecture (OPC UA). With OPC UA, the OPC Foundation fulfills a technology shift from the retiring COM/DCOM technology to a service-oriented architecture providing data in a platform-independent manner via Web Services or its own optimized TCP-based protocol. OPC UA unifies the previous specifications into one single address space capable of dealing with current data, alarms and events and the history of current data as well as the event history. A remarkable enhancement of OPC UA is the Address Space Model by which vendors can expose a rich and extensible information model using object-oriented techniques. OPC UA scales well from intelligent devices, controllers, DCS, and SCADA systems up to MES and ERP systems. It also scales well in its ability to provide information; on the lower end, a model similar to Classic OPC can be used, providing only base information, while at the upper end, highly sophisticated models can be described, providing a large amount of metadata including complex type hierarchies.

Nowadays, Smart Grid has become an established synonym for modern electric power systems. Electric networks are fed less and less by large, centrally planned fossil and nuclear power plants but more and more by millions of smaller, renewable and mostly weather-dependent generation units. A secure energy supply in such a sustainable and ecological system requires a completely different approach for planning, equipping and operating the electric power systems of the future, especially by using flexibility provisions of the network users according to the Smart Grid concept. The book brings together common themes beginning with Smart Grids and the characteristics of power plants based on renewable energy with highly efficient generation principles and storage capabilities. It covers the advanced technologies applied today in the transmission and distribution networks and innovative solutions for maintaining today's high power quality under the challenging conditions of large-scale shares of volatile renewable energy sources in the annual energy balance. Besides considering the new primary and secondary technology solutions and control facilities for the transmission and distribution networks, prospective market conditions allowing network operators and the network users to gain benefits are also discussed. The growing role of information and communication technologies is

investigated. The importance of new standards is underlined and the current international efforts in developing a consistent set of standards are updated in the second edition and described in detail. The updated presentation of international experiences to apply novel Smart Grid solutions to the practice of network operation concludes this book. *The Introduction of IEC 61850 and Its Impact on Protection and Automation Within Substations* World Scientific
