Over the last three decades the process industries have grown very rapidly, with corresponding increases in the quantities of hazardous materials in process,

storage or transport. Plants have become larger and are often situated in or close to densely populated areas. Increased hazard of loss of life or property is continually highlighted with incidents such as Flixborough, Bhopal, Chernobyl, Three Mile Island, the Phillips 66 incident, and Piper Alpha to name but a few. The field of Loss Prevention is, and continues to, be of supreme importance to countless companies, municipalities and governments around the world, because of the trend for processing plants to become larger and often be situated in or close to densely populated areas, thus increasing the hazard of loss of life or property. This book is a

detailed guidebook to defending against these, and many other, hazards. It could without exaggeration be referred to as the "bible" for the process industries. This is THE standard reference work for chemical and process engineering safety professionals. For years, it has been the most complete collection of information on the theory, practice, design elements, equipment, regulations and laws covering the field of process safety. An entire library of alternative books (and cross-referencing systems) would be needed to replace or improve upon it, but everything of importance to safety professionals, engineers and managers can be found

in this all-encompassing reference instead. Frank Lees' world renowned work has been fully revised and expanded by a team of leading chemical and process engineers working under the guidance of one of the world's chief experts in this field. Sam Mannan is professor of chemical engineering at Texas A&M University, and heads the Mary Kay O'Connor Process Safety Center at Texas A&M. He received his MS and Ph.D. in chemical engineering from the University of Oklahoma, and joined the chemical engineering department at Texas A&M University as a professor in 1997. He has over 20 years of experience as an

engineer, working both in industry and academia. New detail is added to chapters on fire safety, engineering, explosion hazards, analysis and suppression, and new appendices feature more recent disasters. The many thousands of references have been updated along with standards and codes of practice issued by authorities in the US, UK/Europe and internationally. In addition to all this, more regulatory relevance and case studies have been included in this edition. Written in a clear and concise style, Loss Prevention in the Process Industries covers traditional areas of personal safety as well as the more technological aspects and thus provides

balanced and in-depth coverage of the whole field of safety and loss prevention. - A must-have standard reference for chemical and process engineering safety professionals - The most complete collection of information on the theory, practice, design elements, equipment and laws that pertain to process safety - Only single work to provide everything; principles, practice, codes, standards, data and references needed by those practicing in the field

In this highly original and meticulously researched comparison of public and private

standards-setting, Ross E. Cheit questions the old maxim that government-set safety standards are too severe while those set by the private sector are too lenient. Identifying the comparative institutional advantages of each arrangement through four paired case studies of grain elevators, woodstoves, aviation fire safety, and gas space heaters, he finds instead that some private standards are surprisingly strict, while government is better positioned to survey real-world experience and sponsor research likely to improve standards-setting. Setting Safety Standards challenges those political scientists who argue that only public

institutions can advance the public interest in the controversial field of health and safety. Cheit draws attention to such little-known organizations as Underwriters Laboratories and the National Fire Protection Association, private-sector alternatives to the government regulation so frequently criticized as time-consuming, inflexible, and unreasonable. These organizations, he shows, play a far more significant role in regulation than most federal agencies, even though the standards they develop are widely—and often mistakenly—assumed to be less concerned with due process than government standards and often unduly lax.

This study should be widely read by public policy and regulation experts in both the public and the private sectors as well as by academics in the field.
