The book is organized into four parts. Part I deals generally with the preparation and study of brain tissue. It includes a chapter on the microscope, discussing optical magnification, limitations of microscopy, and optical contrasting methods. Other chapters summarize basic techniques for tissue preparation and sectioning; present guidelines for a number of standard, but essential, staining procedures; and present sophisticated and contemporary computer techniques that are proving to be invaluable as neuroanatomy evolves from a qualitative to a quantitative discipline. Part II deals with techniques often used for the study of normal tissue. These include the Golgi method, fluorescence histochemistry, techniques for staining single neurons, and the use of the electron microscope. Part III presents techniques for studying intrinsic connections of the nervous system. These include techniques for silver impregnation of degenerating fibers; autoradiographic technique for studying axonal projections; and somatopetal movement of horseradish peroxidase as a tool for studying connections and neuron morphology. Part IV discusses the interpretation of results from neuroanatomical research techniques and presents examples of the applications of neuroanatomical methods to major problems in physiological psychology.

For undergraduate level courses in Cognition and Theories of Learning. The psychology of human memory and cognition is fascinating, dealing with questions and ideas that are inherently interesting, such as how we think, reason, remember, and use language. Using a first person narrative, posing direct questions to the reader, and balancing classic research with cutting edge topics, the author draws in the reader and conveys the excitement of the field. Reflecting the increasing use of new technologies to study memory and cognition, Ashcraft and the new co-author, Gabriel Radvansky, continue to integrate sections on neurosciences within individual chapter topics.

Imaging Anatomy of the Human Spine Pearson College Division Defines learning and shows how the learning process is studied. Introduction to Biopsychology Prentice Hall

In 1967, after a twin baby boy suffered a botched circumcision, his family agreed to a radical treatment that would alter his gender. The case would become one of the most famous in modern medicine—and a total failure. *As Nature Made Him* tells the extraordinary story of David Reimer, who, when finally informed of his medical history, made the decision to live as a male. A macabre tale of medical arrogance, it is first and foremost a human drama of one man's—and one family's—amazing survival in the face of terrible odds.

Pinel encourages interactive learning and creative thinking. His clear and engaging presentation makes the material personally and socially relevant to the reader. For undergraduate junior/senior level courses in Behavioral Neuroscience, Physiology of Behavior, Biopsychology, Human Neuropsychology, or Physiological Psychology. Biopsychology is an introduction to the study of the biology of behavior; it focuses on the neural mechanisms of psychological processes. The defining feature of Biopsychology is its unique combination of cutting-edge biopsychological science and student-oriented discourse. Rather than covering topics in the usual textbook fashion, it interweaves the fundamentals of the field with clinical case studies, personal implications, social issues, helpful metaphors, and memorable anecdotes.
