More complex and imposing than any other vehicle in the British emergency services, the fire engine has a long and interesting history. The earliest water pumps had been developed by the eighteenth century - basic manual pumps that had to be hauled around by people or horses, and were often only used on fire-insured premises. In the nineteenth and twentieth centuries horse-drawn, steam-powered fire engines, and eventually motorised fire engines, came to revolutionise firefighting, offering far greater versatility and the brigades came to be run by the municipalities. In this beautifully illustrated introduction, Eddie Baker charts the history of fire engines and their variants, and the increasingly complex equipment they have carried, such as high-rise ladders and high-pressure hoses. He also explains the wider history of the fire service and how the engines have been shaped by its needs and, most importantly, those of the firefighters themselves.

The concept of sustainability is already applied in all industrial sectors. The fight against climate change therefore forces us to look for alternatives in the way we move. Different alternative fuels are discussed in this book: from liquid and gaseous biofuels to electricity. Moreover, waste to fuel processes are another option to produce a significant amount of fuels. In the spirit of this book, there is not only collecting different alternatives, but creativity is also promoted in the readers of this book, so that they take an active part of the solution necessary to reduce greenhouse gas emissions.

The Year 2000 Amberley Publishing Limited

In 1979, fresh from its general election victory, the Conservative government began formulating plans to deregulate bus services and privatise the companies operating them in England, Scotland and Wales. London was not to be excluded, so from the outset, London Buses was broken up into several areas and from 1985, a tendering system was introduced which permitted other operators to bid for the routes. Opposition from the Labour group at the Greater London Council had to be dealt with - eventually achieved by abolishing it in 1986. However, as each subsequent year passed, promises that deregulation was coming were not met. In late 1992, the privatisation timetable was set, and was ultimately completed at the end of 1994. The issue of deregulation never resurfaced. Copiously illustrated with over 270 photographs, virtually all of which are being published for the first time, this is the story of London Buses over those sixteen tumultuous years. To give greater context to the narrative, annual vehicle acquisition listings show how purchasing policy changed over the period; important route changes, tendering gains and losses and a fleet list for the entire period are also included.

Technological change is a central feature of modern societies and a powerful source for social change. There is an urgent task to direct these new technologies towards sustainability, but society lacks perspectives, instruments and policies to accomplish this. There is no blueprint for a sustainable future, and it is necessary to experiment with alternative paths that seem promising. Various new transport technologies promise to bring sustainability benefits. But as this book shows, important lessons are often overlooked because the experiments are not designed to challenge the basic assumptions about established patterns of transport choices. Learning how to organise the process of innovation implementation is essential if the maximum impact is to be achieved - it is here that strategic niche management offers new perspectives. The book uses a series of eight recent experiments with electric vehicles, carsharing schemes, bicycle pools and fleet management to illustrate the means by which technological change must be closely linked to social change if successful implementation is to take place. The basic divide between proponents of technological fixes and those in favour of behavioural change needs to be bridged, perhaps indicating a third way.
