The decomposition process itself is called a Fourier transformation. Its output, the Fourier transform, is often given a more specific name, which depends on the domain and other properties of the function being transformed. Fourier analysis - Wikipedia The modal method is one of the most effective methods for modeling diffraction of electromagnetic waves by periodic gratings. Its basic idea is quite simple: The electromagnetic fields are first solved as eigenfunctions of Maxwell's equations in the interior of the grating region where the periodic permittivity variation occurs.
