Applications of Dynamic Systems Theory to Cognition and ... Applications Of Dynamical Systems InA dynamical system is a manifold M called the phase (or state) space endowed with a family of smooth evolution functions Φ_t that for any element $t \in T$, the time, map a point of the phase space back into the phase space. The notion of smoothness changes with applications and the type of manifold. A dynamical system is all about the evolution of something over time. To create a dynamical system we simply need to decide what is the "something" that will evolve over time and what is the rule that specifies how that something evolves with time.
