Chemical Process Safety McGraw-Hill Science, Engineering & Mathematics

While existing books related to DOE are focused either on process or mixture factors or analyze specific tools from DOE science, this

text is structured both horizontally and vertically, covering the three most common objectives of any experimental research: * screening designs * mathematical modeling, and * optimization. Written in a simple and lively manner and backed by current chemical product studies from all around the world, the book elucidates basic concepts of statistical methods, experiment design and optimization techniques as applied to chemistry and chemical engineering. Throughout, the focus is on unifying the

theory and methodology of optimization with well-known statistical and experimental methods. The author draws on his own experience in research and development, resulting in a work that will assist students, scientists and engineers in using the concepts covered here in seeking optimum conditions for a chemical system or process. With 441 tables, 250 diagrams, as well as 200 examples drawn from current chemical product studies, this is an invaluable and convenient source of information

for all those involved in process optimization.

'Chemical engineering is the field of applied science that employs physical, chemical, and biological rate processes for the betterment of humanity'. This opening sentence of Chapter 1 has been the underlying paradigm of chemical engineering. Chemical Engineering: An Introduction is designed to enable the student to explore the activities in which a modern chemical engineer is involved by focusing on mass and energy balances in liquid-phase processes. Problems explored include the design of a feedback level controller, membrane separation, hemodialysis, optimal design of a process with chemical reaction and separation, washout in a bioreactor, kinetic and mass transfer limits in a two-phase reactor, and the use of the membrane reactor to overcome equilibrium limits on conversion. Mathematics is employed as a language at the most elementary level. Professor Morton M. Denn incorporates design meaningfully; the design and analysis problems are realistic in format and scope.

DESIGN OF EXPERIMENTS IN CHEMICAL ENGINEERING

Pearson Education

This volume of case studies serves as a guide and reference manual for the application of engineering science fundamentals in the solution of chemical development and process design problems. The introductory chapter describes a set of general principles relevant to the analysis of industrial design problems. An extensive bibliography is presented which provides a valuable theoretical and practical basis for proper understanding of the case studies. The six case studies present an opportunity for the detailed application of the broad principles outlined in the introduction. These cases vary widely both in regard to the engineering operations analyzed and with respect to the complexity and detail of the required solution. Three of the analyses result in computer programs which may be utilized for a more comprehensive design evaluation and for student discussion in a "computerized classroom." Each case represents a useful approach to a general class of design studies, and each has been reviewed by an industrial or academic expert familiar with current commercial practice. Therefore, even though the reproduction of specific industrial designs has not been attempted, each solution has been compared and contrasted with the realities of modern industrial operations. Various approaches to the financial evaluation of a chemical project are described. These are presented in some detail since material of this type is frequently absent from academic curricula.
