In this groundbreaking narrative,
longtime Washington Post reporter Craig
Timberg and award-winning AIDS
researcher Daniel Halperin tell the

surprising story of how Western colonial
powers unwittingly sparked the AIDS
epidemic and then fanned its rise.
Drawing on remarkable new science,
Tinderbox overturns the conventional
wisdom on the origins of this deadly
pandemic and the best ways to fight it
today. Recent genetic studies have
traced the birth of HIV to the forbidding
equatorial forests of Cameroon, where

chimpanzees carried the virus for millennia without causing a major outbreak in humans. During the Scramble for Africa, colonial companies blazed new routes through the jungle in search of rubber and other riches, sending African porters into remote regions rarely traveled before. It was here that humans first contracted the strain of HIV that would eventually cause 99 percent of AIDS deaths around the world. Western powers were key actors in turning a localized outbreak into a sprawling epidemic as bustling new trade routes, modern colonial cities, and the rise of prostitution sped the virus across Africa. Christian missionaries campaigned to suppress polygamy, but left in its place fractured sexual cultures that proved uncommonly vulnerable to

HIV. Equally devastating was the gradual loss of the African ritual of male circumcision, which recent studies have shown offers significant protection against infection. Timberg and Halperin argue that the same Western hubris that marked the colonial era has hamstrung the effort to fight HIV. From the United Nations AIDS program to the Bush administration's historic relief campaign, global health officials have favored well-meaning Western approaches--abstinence campaigns, condom promotion, HIV testing--that have proven ineffective in slowing the epidemic in Africa. Meanwhile they have overlooked homegrown African initiatives aimed squarely at the behaviors spreading the virus. In a riveting narrative that stretches from colonial Leopoldville to

1980s San Francisco to South Africa today, Tinderbox reveals how human hands unleashed this epidemic and can now overcome it, if only we learn the lessons of the past.

Global Health Governance and the Fight Against HIV/AIDS Elsevier Health Sciences

The book focuses on HIV/AIDS prevention and treatment strategies in resource-poor settings. Contributors include HIV/AIDS researchers and public health administrators from the US, Africa, China, and Thailand. Several chapters, written by local health officials, take a close look at AIDS prevention and treatment in China at the community level. Other chapters cover issues of treatment scale-up, drug resistance, and mother-to-child transmission in Southern

Africa and Thailand, and offer lessons learned for researchers in other developing countries. Overall the aim of this book is to bring some of the latest issues to the fore, and to foster exchange and collaboration between AIDS researchers in developing countries. This book grew out of an annual conference held in China and organized by the Harvard School of Public Health, and could possibly become the first volume of a series.

The 1992 creation of the National HIV/AIDS Program was a fundamental step for Argentina to reach the second

lowest burden of HIV/AIDS in South America. From 2000 to 2010, Argentina further reduced the already low HIV/AIDS incidence of 15.9 per 100,000 by 25 percent and reduced the burden by 21 percent. This study analyzes the national and inter-provincial burden of disease, the demographics of new HIV cases, the demand and supply-sides of service delivery, and conducts a cost-benefit analysis of the National HIV/AIDS Program over the last decade. Though the National HIV/AIDS Program was an instrumental step towards these achievements, this book also examines other key programmatic innovations that have been essential to the country's success in the fight against HIV/AIDS, including the introduction of universal free antiretroviral treatment; a

comprehensive legal framework for sexual and reproductive rights; the introduction of incentives and results-based financing in the HIV/AIDS program; electronic monitoring of supplies and medicines; and implementation of an electronic clinical governance system for improving the quality of care and patient follow-up, among others. Despite high costs of the Program, this study found the Argentine National HIV/AIDS Program is cost-beneficial. From 2000 to 2010, 4,379 potential lives were saved. Nonetheless, the fight against this epidemic poses continuous challenges, including a stubbornly high number of new infections among young men who have sex with men, inequalities in HIV/AIDS rates between provinces, insufficient

coverage of HIV diagnostic testing, insufficient HIV testing of tuberculosis patients, low expenditure on HIV prevention, high comparative cost of antiretroviral treatment, and questions regarding the long-term financial sustainability of the AIDS program, considering the increasing number of patients in treatment. 'Thirty Years of the HIV/AIDS Epidemic in Argentina: An Assessment of the National Health Response' delves into the combination of factors that make Argentina a success story in combating HIV/AIDS.

This book introduces a number of HIV/AIDS cases with mucocutaneous lesions. HIV/AIDS can manifest a variety of skin lesions due to immunological disorder, opportunistic infections and

tumors always occur primarily with skin lesions. The cases included in this book reflect the diseases spectrum and evolution of mucocutaneous lesions at different stages before and after AIDS antiretroviral therapy (ART) as well. This book consists of nine chapters, including fungal, viral, bacterial, parasitic, neoplastic, inflammatory diseases, syphilis and ART-induced diseases, etc. More than 300 cases and 600 photos of representative and important clinical significances are selected, showing the different clinical characteristics of the same disease under different immune status. Clinical photos are combined with clear and concise medical history along with the discussion on it, by which the readers can understand why skin lesions can be used as the early diagnostic clues

to HIV/AIDS infection. Moreover, every chapter summarizes the similarity and characteristics of each type of skin diseases, which outlines and explains why they are AIDS-related mucocutaneous lesions.

Society was not prepared in 1981 for the appearance of a new infectious disease, but we have since learned that emerging and reemerging diseases will continue to challenge humanity. AIDS at 30 is the first history of HIV/AIDS written for a general audience that emphasizes the medical response to the epidemic. Award-winning medical historian Victoria A. Harden approaches the AIDS virus from philosophical and intellectual

perspectives in the history of medical science, discussing the process of scientific discovery, scientific evidence, and how laboratories found the cause of AIDS and developed therapeutic interventions. Similarly, her book places AIDS as the first infectious disease to be recognized simultaneously worldwide as a single phenomenon. After years of believing that vaccines and antibiotics would keep deadly epidemics away, researchers, doctors, patients, and the public were forced to abandon the arrogant assumption that they had conquered infectious diseases. By presenting an accessible discussion of the history of HIV/AIDS and analyzing how aspects of society advanced or hindered the response to the disease, AIDS at 30 illustrates for both medical

professionals and general readers how medicine identifies and evaluates new infectious diseases quickly and what political and cultural factors limit the medical community's response.

This book focuses on the issues encountered by children and young people who are living with HIV/AIDS. It

examines their lived experiences associated with HIV/AIDS, and studies groups of children and youngsters from around the globe. Connecting empirical information with real-life situations, the book brings together results from empirical research that relates to these children and young people. Its chapters can be used as evidence for health care providers to implement socially and culturally appropriate services to assist individuals and groups of children and young people who are living with HIV/AIDS in many societies. Many of these young people are from the most marginalized and vulnerable groups; and many have been orphaned by the death of their HIV-positive parents. Marginalized young people such as refugees, migrants and street children

are most at risk due to the use of illicit drugs, their exposure to unprotected sex (in exchange for food, money and protection), and stigma associated with their marginalized lives. The impact that HIV/AIDS has on the opportunities for these young people to be able to lead healthy adult lives is considerable. This book gives a voice to these children and young people and advances our understanding of their lived experiences and needs.

HIV/AIDS is without doubt the worst epidemic to hit humankind since the Black Death. The first case was identified in 1981; by 2004 it was estimated that about 40 million people were living with the disease, and about 20 million had

died. Despite rapid scientific advances there is still no cure and the drugs are expensive and toxic. Because of controversies and taboos surrounding safe drug usage and prostitution, the numbers of people infected continues to rise. However, it is in the developing world and especially parts of Africa that the real catastrophe is unfolding. In some of the worst affected countries life expectancy has plummeted to below 35 years, which has led to a serious decline in economic growth, a sharp rise in orphaning, and the imminent collapse of health care systems. The news is not all bleak though. There have been unprecedented breakthroughs in understanding diseases and developing drugs. Because the disease is so closely linked to sexual activity and drug use,

the need to understand and change behaviour has caused us to reassess what it means to be human and how we should operate in the globalising world. This Very Short Introduction provides an introduction to the disease, tackling the science, the international and local politics, the fascinating demographics, and the devastating consequences of the disease, and explores how we have — and must — respond. ABOUT THE SERIES: The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area. These pocket-sized books are the perfect way to get ahead in a new subject quickly. Our expert authors combine facts, analysis, perspective, new ideas, and enthusiasm to make interesting and challenging

topics highly readable.

There are about 34 million people

worldwide living with HIV/AIDS. Half are women. There has been a dramatic global increase in the rates of women living with HIV/AIDS. Among young women, especially in developing countries, infection rates are rapidly increasing. Many of these women are also mothers with young infants. When a woman is labeled as having HIV, she is treated with suspicion and her morality is being questioned. Previous research has suggested that women living with HIV/AIDS can be affected by delay in diagnosis, inferior access to health care services, internalized stigma and a poor utilization of health services. This makes it extremely difficult for women to take care of their own health needs. Women are also reluctant to disclose their HIV-positive status as they fear this may

result in physical feelings of shame, social ostracism, violence, or expulsion from home. Women living with HIV/AIDS who are also mothers carry a particularly heavy burden of being HIV-infected. This unique book attempts to put together results from empirical research and focuses on issues relevant to women, motherhood and living with HIV/AIDS which have occurred to individual women in different parts of the globe. The book comprises chapters written by researchers who carry out their projects in different parts of the world, and each chapter contains empirical information based on real life situations. This can be used as evidence for health care providers to implement socially and culturally appropriate services to assist individuals and groups who are living

with HIV/AIDS in many societies. The book is of interest to scholars and students in the domains of anthropology, sociology, social work, nursing, public health & medicine and health professionals who have a specific interest in issues concerning women who are mothers and living with HIV/AIDS from cross-cultural perspective. [Dealing with HIV and AIDS in the Classroom](#) World Bank Publications For teachers looking to lead the way in shifting attitudes about HIV and AIDS, this helpful resource offers the information needed to effectively raise awareness in students. One of the most important aspects of AIDS is the loss of protective immune function in the infected host which leads to increased prevalence of opportunistic infections and cancers. This book specifically addresses viral-induced human cancers associated with AIDS and observed in the AIDS population. It addresses the specific treatment required in this special population and the molecular biology of the causative viral agents.

HIV/AIDS continues to take a tremendous toll on the populations of

many countries, especially in sub-Saharan Africa. In some countries with high HIV prevalence rates, life expectancy has declined by more than a decade and in a few cases by more than two decades. Even in countries with HIV prevalence of around 5 percent (close to the average for sub-Saharan Africa), the epidemic can reverse gains in life expectancy and other health outcomes achieved over one or two decades. This volume highlights work conducted under the umbrella of a World Bank work program on "The Fiscal Dimension of HIV/AIDS," including country studies on Botswana, South Africa, Swaziland, and Uganda. It covers four aspects of the fiscal dimensions of HIV/AIDS: First, it aims for a comprehensive analysis of the fiscal costs of HIV/AIDS, with a wider

scope than a costing analysis focusing on only the policy response to HIV/AIDS. Second, it embeds the analysis of HIV/AIDS costs in a discussion of the fiscal context, and interprets these costs as a quasi-liability, not a debt de jure, but a political and fiscal commitment that binds fiscal resources in the future and cannot easily be changed, and very similar to a pension obligation or certain social grants or services. Third, it develops tools to assess the (fiscal dimensions of) trade-offs between HIV/AIDS policies and measures that take into account the persistence of these spending commitments. Fourth, most of the fiscal costs of HIV/AIDS are ultimately caused by new infections, and this study estimates the fiscal resources committed (or saved) by an additional

(or prevented) HIV infection. Building on these estimates, the analysis here is able to assess the evolving fiscal burden of HIV/AIDS over time.

This text provides a concise yet comprehensive review of GI tract complications of HIV infection. Beginning with an overview on the pathophysiology of HIV and its direct effect on the GI tract, the book outlines opportunistic infections, noninfectious etiologies, diagnostic testing, and therapy in relation to specific organs in the GI tract. Organs covered include the esophagus, stomach, gallbladder and biliary tract, liver, pancreas, and small and large intestines. Written by experts in the

field, HIV and GI Tract Complications: A Comprehensive Clinical Guide is a valuable resource for clinicians and researchers interested in HIV/AIDS and associated GI tract complications, that will help guide patient management and stimulate investigative efforts.
