“A stunning book.”—Oliver Sacks Memory binds our mental life together. We are who we are in large part because of what we learn and remember. But how does the brain create memories? Nobel Prize winner Eric R. Kandel intertwines the intellectual history of the powerful new science of the mind—a combination of cognitive psychology, neuroscience, and molecular biology—with his own personal quest to understand memory. A deft mixture of memoir and history, modern biology and behavior, *In Search of Memory* brings readers from Kandel's childhood in Nazi-occupied Vienna to the forefront of one of the great scientific endeavors of the twentieth century: the search for the biological basis of memory.

Using a single treatment model that can be applied to every patient, this unique book is a valuable guide for assessing, identifying, and treating patients with acute and chronic pain in physical therapy practice. It teaches clinicians how to quickly recognize pain patterns and deal with pain using practical pain management techniques (psychosocial interventions, self-help methods) in combination with familiar musculoskeletal approaches (massage, exercise therapy, TENS). Underlying concepts of neurophysiology endocrine physiology, and psychology are explained to convey a greater understanding of pain science and its links to everyday practice. 'PAIN IN PRACTICE is a very readable user friendly book. it approaches the subject of pain from different perspectives with the overriding theme being relevance to clinical reasoning and thus treatment of patients...The book is well designed with the use of green shaded boxes to summarize or highlight important points. there is good use of patient scenarios to facilitate the linking of theory to practice and the many diagrams and flow charts support the text well.' The British Pain Society Newsletter, Spring 2006. Material is organized according to the hierarchy in the sensory nervous system, from familiar to the increasingly complex causes of pain. A single, overarching clinical reasoning model is presented that integrates psychological, neural, and mechanical knowledge, enabling therapists to assess and treat all patients using the same model. The book's rational approach to analyzing pain syndromes discards overly simplistic notions of pain as a mechanical phenomenon. A comprehensive review of outcome measures is provided, which serves as a convenient reference guide for evaluation and clinical practice. Text boxes highlight patient examples, exercises, and interesting background information. Relevant neurophysiology is discussed in a way that translates the information into practical application. Integrative approach to pain management empowers therapists to use familiar musculoskeletal methods in addition to psychosocial methods, enabling them to choose the most appropriate techniques from both areas.

In Search of Memory: The Emergence of a New Science of Mind OUP Oxford

Two distinguished neuroscientists distil general principles from more than a century of scientific study, "reverse engineering" the brain to understand its design. Neuroscience research has exploded, with more than fifty thousand neuroscientists applying increasingly advanced methods. A mountain of new facts and mechanisms has emerged. And yet a principled framework to organize this knowledge has been missing. In this book, Peter Sterling and Simon Laughlin, two leading neuroscientists, strive to fill this gap, outlining a set of organizing principles to explain the whys of neural design that allow the brain to compute so efficiently. Setting out to "reverse engineer" the brain—disassembling it to understand it—Sterling and Laughlin first consider why an animal should need a brain, tracing computational abilities from bacterium to protozoan to worm. They examine bigger brains and the advantages of "anticipatory regulation"; identify constraints on neural design and the need to "nanofy"; and demonstrate the routes to efficiency in an integrated molecular system, phototransduction. They show that the principles of neural design at finer scales and lower levels apply at larger scales and higher levels; describe neural wiring efficiency; and discuss learning as a principle of biological design that includes "save only what is needed." Sterling and Laughlin avoid speculation about how the brain might work and endeavor to make sense of what is already known. Their distinctive contribution is to gather a coherent set of basic rules and exemplify them across spatial and functional scales.
