Featuring original anatomical dissection photographs prepared by Shahan K. Sarrafian, MD, FACS, FAOS, ABOS, Sarrafian's Anatomy of the Foot and Ankle is the classic book in foot and ankle anatomy. Meticulously updated, this new edition captures all of today's clinical knowledge on the anatomy of the foot and ankle. Detailed coverage of functional anatomy, applied anatomy biomechanics, and cross-sectional anatomy further enhances your understanding of the complexities associated with disorders of the foot and ankle.

Within a few years the surgical approach to abdominal wall hernias has focused on mesh-based treatment options. This dramatic change has set the stage for the third Suvretta meeting. All aspects of the mesh world have been discussed in detail by more than 50 international experts during an intense week

resulting in an assessment of success and failures. After posing the question, whether meshes have defeated recurrences in the groin, epidemiological clinical data on recurrences were presented and show that this problem still exists. In particular, novel molecular biology-based research results stress the pathophysiological importance of a defective scarring process in these patients with inherent conclusions for future therapies. Regarding the variety existing meshes, there are already more than 100 different mesh devices, a comprehensive review of their chemical and textile properties was presented, with emphasis on their impact on biological responses. However, more than 90% of the participants articulated the need for improved mesh prosthesis, because their characteristic inflammatory and fibrotic foreign body reaction cause minor and major complications, e.g. pain, infections, adhesions, damage of the spermatic cord. The differentiated use of meshes in various procedures was discussed, including groin, incisional, parastomal, diaphragmal and hiatal hernias as well as their use in extended abdominal wall defects or in paediatric or plastic surgery. In summary this book summarizes the most up-to-date knowledge about meshes and hopefully serve as manual for both practical surgeons and

scientists involved in the growing world of mesh.

This book focuses on the anatomy of the peripheral nervous system. Using the latest 3D-computer graphic modeling techniques, the author developed the innovative NEURO 3D LOCATOR™ concept, which provides 3D in-vivo ultrasound images of peripheral nerve architectures, allowing readers to develop a mental real-time 3D GPS of the peripheral nervous system. This new edition is an extended version of the "Student edition" dedicated to Experts and is divided into three main parts: The first part describes fundamental concepts, from immunohistochemistry to limb innervation, and includes a detailed evaluation of the morphofunctional anatomy of the peripheral nerves. It also presents relevant data on neuromuscular transmission, from both classic and recent literature, to enable readers to gain an understanding the physiology and pathology of peripheral nerves as well as the prospects of repair. The second section addresses the upper limb, the brachial plexus and related peripheral nerves, while the third section focuses on the lower limb, the lumbosacral plexus and related peripheral nerves. By providing MRI sections related to the drawings and the descriptions of main nerve injuries, it facilitates radiological interpretation and clinical learning. The book also features detailed descriptions of surgical approaches and the ultrasound anatomy of the limbs, and includes supplementary material on applications to peripheral nerve stimulation, surgical procedures and interventional pain medicine techniques. Presenting high-quality 3D videos showing the progression of the ultrasound probe in real-time, synchronized with live ultrasound views and enhanced with anatomical computerized graphic layers, as well as over 500 outstanding full-color 2D and 3D illustrations, and access to than 100 practical videos, this unique book is a valuable resource for anesthesiologists, radiologists, orthopedic surgeons, neurosurgeons, neuromodulators, physiatrists, pain physicians and rheumatologists. It will also appeal to the medical community in general.

This book contains 800 precise black and white photographs (many of which have never appeared in written works before) which are spread out over 12 chapters. They clearly illustrate the surface investigation of the different anatomical structures (bones, ligaments, tendons, muscles and neurovascular system) and each is accompanied by a technical description. A reference manual for both students and practitioners, this book is also a methodological guide to a more practical and professional application of anatomy. Written to be both practical and concrete, it is of service to a diagnostic procedure in which palpation is one of the vital methods of clinical examination.

This book provides a detailed review of neurogenic pelvic dysfunctions following a suprapontine lesion, since a clear understanding of the pathogenesis of vesical and bowel dysfunctions has become increasingly important in medical education. It covers both urinary incontinence and retention, constipation and faecal incontinence resulting from ischemic, haemorrhagic and traumatic brain injury and Parkinson's disease. It also offers a concise yet comprehensive summary of the neurologic examination of the pelvis: all chapters include the most up-to-date scientific and clinical information with the relevant level of clinical evidence. The book is divided into three sections, which integrate basic science with clinical medicine. The first section features a general introduction and essential background into micturition and bowel neural control, focusing on cortical control. Section 2 is devoted to common clinical problems regarding the neurologic assessment of the perineum, while the last section summarises urological and bowel dysfunction in suprapontine lesions. Providing a clear, concise and informative introduction to urology, it is a practical guide for professionals, medical students and residents in Physical Medicine and Rehabilitation, Urology and Neurology.
