About a decade ago we edited The Psychology of Humor. Besides the summary chapter and bibliography of about 400 items, the book contained eleven original papers that represented the state of knowledge at that time. We confess that it was not easy to fill that volume with first-rate contributions. In a few instances we invited contributors only on the basis of having heard through the grapevine that they were doing interesting work on humor. Our sources proved reliable and we were pleased with the results. We even made new friends as a result of these blind invitations. But

the fact remains that in the early 1970s there was only a handful of social scientists studying humor and laughter. The history of humor research prior to the 1970s can also be characterized in terms of the short-term commitment to investigating humor among those who did venture out and try their hand at designing humor studies. For reasons that remain unclear, many investigators published only one or two humor studies before abandoning the area in favor of some other research domain. We have the impression that for decades social scientists have been very intrigued by the idea of studying humor. Psychologists have suspected for a long time that humor somehow is very important in the lives of people. We find laughter and humor occurring almost wherever we find people engaged in social interaction.

The lesser known and explored of the two pillars of Hinduism--=a'srama and var.na--=a'srama is the name given to a system of four distinct and legitimate ways of leading a religious life: as a celibate student, a married householder, a forest hermit, and a world renouncer. In this, the first full-length study of the =a'srama system, Olivelle uncovers its origin and traces its subsequent history. He examines in depth its relationship to other institutional and doctrinal aspects of the Brahmanical world and its position within Brahmanical theology, and assesses its significance within the history of Indian religion. Throughout, he argues that the =a'srama system is primarily a theological construct and that the system and its history should be carefully distinguished from the socio-religious institutions comprehended by the system and from their respective histories.

PRIORITIES OF GOVERNMENTS

Oxford University Press on Demand

I was asked recently to prepare an independent background report on the subject of priority assessment in science and technology policy for the Australian Science and Technology Council. The Council (while not necessarily endorsing this book) suggested that a wider audience could be interested in the type of material contained in my report and kindly gave me permission to publish the material in my own right. The present book contains this and other material, some of which was presented at a seminar on National Science Policy: Implications for Government Departments arranged by the Department of Science and the Environment. Additional ideas were developed in response to comments on the manuscript by referees, as a result of discussions with Professor John Metcalfe and Dr Peter Stubbs of Manchester University, a conversation with Dr Keith Hartley of the University of York and in the wake of a communication from Dr Ken Tucker, Assistant Director, Bureau of Industry Economics, Australia. Science and technology policy affects and concerns everyone of us if for no other reason than we cannot escape in this interdependent world from the economic, social and environmental ivers pills generated by science and technology. We must face the problems and promises inherent in new and existing science and technology whether we like it or not. Not surprisingly this book finds that all industrialized countries seem to be facing similar economic and social problems.

Multithreaded computer architecture has emerged as one of the most promising and exciting avenues for the exploitation of parallelism. This new field represents the confluence of several independent research directions which have united over a common set of issues and techniques. Multithreading draws on recent advances in dataflow, RISC, compiling for fine-grained parallel execution, and dynamic resource management. It offers the hope of dramatic performance increases through parallel execution for a broad spectrum of significant applications based on extensions to `traditional' approaches. Multithreaded Computer Architecture is divided into four parts, reflecting four major perspectives on the topic. Part I provides the reader with basic background information, definitions, and surveys of work which have in one way or another been pivotal in defining and shaping multithreading as an architectural discipline. Part II examines key elements of multithreading, highlighting the fundamental nature of latency and synchronization. This section presents clever techniques for hiding latency and supporting large synchronization name spaces. Part III looks at three major multithreaded systems, considering issues of machine organization and compilation strategy. Part IV concludes the volume with an analysis of multithreaded architectures, showcasing methodologies and actual measurements. Multithreaded Computer Architecture: A Summary of the State of the Art is an excellent reference source and may be used as a text for advanced courses on the subject.

This book introduces undergraduates to critical perspectives on the relationship between media and society, and to ideas about the production of meaning through media. The opening chapters provide a foundation to understanding the triangular relationship between media businesses (institutions) and texts and audiences. Succeeding chapters look at specialist areas such as popular music, news, new technologies, advertising and globalization. .There is a development and application of ideas about such key terms as representation, difference, discourse and ideology. The student reader is encouraged to take on different views around issues relating to questions of media power, media influence, audience consumption. There is an emphasis on applying ideas to

media practices and media texts. There is engagement with debates around such topics as public service broadcasting and the public sphere. Students are introduced to a range of key thinkers and their ideas as concepts, issues and debates are introduced..The reader is engaged through key questions, case studies, illustrations and diagrams, as well as a clearly argued text bedded in examples. .This book is already used both as a foundation at level 1 for degree courses in media studies, as a key text for general media modules at different levels, and as a key text at various levels in respect of specific chapters supporting specific modules and their topics..

Critical Appraisal of Medical Literature provides a step-by-step approach to help the reader reach a good level of proficiency in systematic critical appraisal of medical information. To this end, the book covers all the elements that are necessary to develop these skills and is a comprehensive guide to the subject. The book is written in three parts. The first part focuses on the logical justification and the validity of medical information. Its chapters present basic working definitions and discussions on relevant basic topics of statistics and epidemiology. The second part focuses on the complementary aspects of critique, common study designs and articles whose main topics are treatment, diagnosis, prognosis, aetiology, reviews, medical guidelines, audit, and qualitative research. The third part presents some statistical techniques that are commonly used in published articles. Critical Appraisal of Medical Literature is intended for those interested in developing critical appraisal skills such as psychiatric trainees preparing for the Critical Review Paper of the MRCPsych Examination in the UK, other practitioners as part of their preparation for examinations, and medical professionals and students as part of their introduction to aspects of systematic critical appraisal of medical information.

This book focuses on the materials used for fuel cells, solar panels, and storage devices, such as rechargeable batteries. Fuel cell devices, such as direct methanol fuel cells, direct ethanol fuel cells, direct urea fuel cells, as well as biological fuel cells and the electrolytes, membranes, and catalysts used there are detailed. Separate chapters are devoted to polymer electrode materials and membranes. With regard to solar cells, the types of solar cells are detailed, such as inorganic-organic hybrid solar cells, solar powered biological fuel cells, heterojunction cells, multi-junction cells, and others. Also, the fabrication methods are described. Further, the electrolytes, membranes, and catalysts used there are detailed. The section that is dealing with rechargeable batteries explains the types of rechargeable devices, such as aluminum-based batteries, zinc batteries, magnesium batteries, and lithium batteries. Materials that are used for cathodes, anodes and electrolytes are detailed. The text focuses on the basic issues and also the literature of the past decade. Beyond education, this book may serve the needs of polymer specialists as well as other specialists, e.g., materials scientists, electrochemical engineers, etc., who have only a passing knowledge of these issues, but need to know more.

"The author begins by describing the classic von Neumann architecture and then presents in detail a number of performance models and evaluation techniques. He goes on to cover user instruction set design, including RISC architecture. A unique feature of the book is its memory-centric approach - memory systems are discussed before processor implementations. The author also deals with pipelined processors, input/output techniques, queuing modes, and extended instruction set architectures. Each topic is illustrated with reference to actual IBM and Intel architectures."-- Jacket.

Dalton, Elias, and Wandersman have answered the challenge of transforming an abstract, theoretical topic into a lively and understandable subject for students. Through concrete examples and consistent pedagogy, this text helps students understand the concepts and provides opportunities for students to apply the concepts. After introducing community psychology and its history, the authors describe methods of community research and discuss how to understand communities from the perspectives of sense of community, coping, and social support. The focus then shifts to community programs and actions: preventing problem behavior and promoting social competence, citizen participation, organizing for community and social change, and program evaluation and development.

The ramifications of the Global Financial Crisis, which erupted in 2007, continue to surprise not only the general public but also finance professionals, economists, and journalists. Faced with this challenge, *Preparing for the Next Financial Crisis* goes back to basics. The authors ask: what do

theory and empirical observations tell us about the causes and the consequences of financial crisis and instability? In what has become an increasingly complex financial world, what lessons can we learn from economic policies, which have been implemented, and research, which has developed extremely rapidly in recent years, so as not to repeat past mistakes? In this comprehensive review of the literature, which is both complete and balanced, the authors highlight the points of consensus among economists and policymakers. They assess the capacity of economic policies and institutions in limiting the cost of financial instability. In conclusion, they ask if the financial system has become safer, in the light especially of the Covid-19 Global Crisis. Ten years after the

GFC crisis, this is a timely review of the reform agenda, the progress made, and the areas where further changes need to be made to address new risks and challenges.
