In Transformative Environmental Constitutionalism, Professor Melanie Jean Murcott writes from a Global South perspective, drawing on South African context to provide a transformative theoretical framework for adjudication of environmental law disputes which could be more responsive to social, environmental, and climate injustices.

National Environmental Management Act, No.107 of 1998 Edward Elgar Publishing

Africa is endowed with commercially viable quantities of several minerals and metals, and, more than ever before, African countries wish to harness

their mineral resources for their economic development. The African mining sector has witnessed a revolution in terms of new mining codes and amendments to extant mining codes, which are designed to achieve a multitude of objectives, including the assertion of greater control over exploitation of mineral resources; optimization of resource royalties and taxes; promotion of equity participation in mining projects; enhancement of indigenization in the form of domestic participation in mineral production and local content requirements; value addition and beneficiation in terms of domestic processing of raw mineral ores and metals in Africa; and the promotion of sustainable practices in the mining sector. This book analyzes the legal and fiscal frameworks for hard-rock mining in several African countries including Botswana, Democratic Republic of Congo, Ethiopia, Ghana, Guinea, Kenya, Namibia, Nigeria, Liberia, Tanzania, Sierra Leone, South Africa, South Sudan, Zambia, and Zimbabwe, with reference to other resource-rich countries. It engages in a comparative analysis of mining statutes in Africa with regard to topics such as the acquisition of mineral rights; types of mineral rights; the nature of mineral rights; the rights and obligations of mineral right holders; security of mineral tenure; surface rights; fiscal regimes including royalty and tax regimes; resource nationalism in the mining sector; management and utilization of mining revenues including benefit-sharing arrangements between mining companies and host communities; environmental stewardship; and sustainable exploitation of mineral resources.

Routledge

One of the key strategies for achieving sustainable development is the use of the process of evaluating the potential environmental impacts of development activities. The procedure of environmental impact assessment (EIA) implements the principle of integration which lies at the core of the concept of sustainable development by providing a process through which potential social, economic and environmental impacts of activities are scrutinised and planned for. Sustainable development may not be achieved without sustained and legally mandated efforts to ensure that development planning is participatory. The processes of public participation play a crucial role in ensuring the integration of the socio-economic impacts of a project into the environmental decision-making processes. Public participation is not the only process, nor does the process always ensure the achievement of sustainable development. Nevertheless, decisions that engage the public have the propensity to lead to sustainable development. The public participation provisions in South Africa's EIA regulations promulgated under the National Environmental Management Act 107 of 1998 show a disjuncture between the idea of public participation and the notion of sustainable development. The provisions do not create a

framework for informed participation and leave a wide discretion to environmental assessment practitioners (EAPs) regarding the form which participation should assume. In order for environmental law, specifically EIA laws, to be effective as tools to promote sustainable development the laws must, among other things, provide for effective public participation. The judiciary must also aid in the process by giving content to the legal provisions on public participation in the EIA process.

MINERAL MINING IN AFRICA

Butterworth-Heinemann

With aquaculture operations fast expanding around the world, the adequacy of aquaculture-related laws and policies has become a hot topic. This much-needed book provides a three-part guide to the complex regulatory landscape. The expert contributors first review the international legal dimensions, including chapters on law of the sea, trade, and access and benefit sharing. Part Two offers regional perspectives, discussing the EU and regional fisheries management organizations. The final part contains eleven case studies exploring how leading aquaculture producing countries have been putting sustainability principles into practice.

Public Involvement in Environmental Impact Assessment WIT Press

The National Environmental Management Act 107 of 1998 is important legislation, providing remedies for preventing or redressing acts that undermine the constitutional right to an environment that is not harmful for peoples' health and well-being. It also promotes access to information and public participation in developments that affect the environment. In this process of evolution, environmental law has unleashed a number of novel principles such as: the participatory principle, the polluter pays principle, the precautionary principle, the inter-generational and intra-generational principles, the prevention principle, the sustainable development principle and so on.

Annual Survey of South African Law

Environmental disputes are ever present. In view of the nature of and the complexity of environmental disputes apposite and unique alternative dispute resolution mechanisms are indispensable for resolving environmental disputes speedily, proficiently and effectively. Section 34 of the Constitution of the Republic of South Africa, 1996 provides the right to have disputes resolved by means of a public hearing before a court, alternatively, where appropriate, by means of an independent, impartial forum. The National Environmental Management Act 107 of 1998 (NEMA) provides alternative dispute resolution mechanisms. The study identifies the provisions of the NEMA, which provides the Alternative Dispute Resolution (ADR). The study also identifies and examines the ADR provisions from other parts of the environmental legislation. These alternative dispute resolution mechanisms are informal and non-litigious. The ADR has not been utilized in environmental disputes in South Africa, although the NEMA provides it. The study examines the nature and requirements for the ADR mechanisms. The study entails an analysis of how these requirements make the ADR mechanisms appropriate for environmental dispute resolution instead of litigation. Litigation has failed to adequately

resolve environmental disputes. The study identifies the disadvantages of using litigation in environmental disputes instead of the ADR. This study analyses the influence of international environmental law on South Africa's environmental legislative developments. The study further identifies international environmental legal instruments which provide for the ADR. These international environmental legal instruments have conventions and resolutions to which South Africa is a party. The study further examines the specific international legal instruments which have been incorporated into the law of the Republic of South Africa. The study will explore the potential of the ADR in resolving environmental disputes, and al

National Environmental Management Act, 1998 (Act No. 107 of 1998) and Regulations

For many years the integration of the location of land use and activities in spatial systems, as well as the provision of transport in movement of goods, services and people, has been recognized as a challenge amongst various specialists, including: engineers, transportation planners, economists, environmentalists, urban and regional planners and developers. The purpose of this book is to address transportation modelling in terms of technology, techniques and methodology application in context to the interface between transportation systems, land use planning, and environmental challenges and application. The methodology of transportation modelling is applied to international practices and application based on specific case studies, inclusive of public transportation projects; transportation modelling techniques in practice; international research agenda; network design and channel strategies; strategic planning; application of technology in traffic surveys and interpretation; emissions from transportation systems; application of mathematical models and the interface between environment, land use and development in terms of location in space and the resulting activities. Of value to both theorists and practitioners, this book references the integration of transportation modelling techniques within an interdisciplinary environment inside all spatial systems.
