Anderson's Ohio Consumer Law Manual Creating Competitive Advantage with Electronic CommerceA Study of the German Insurance Industry To some, the near perfection of the Six Sigma management system appears to be an impossible ideal, especially for small and medium enterprises.

FIT SIGMATM, a flexible and more sustainable approach, was developed through the integration of the 'hard' Six Sigma approach with Lean Enterprise philosophy. It consists of three elements; fitness for purpose, fitness for improvement and integration, and fitness for sustainability. FIT SIGMA: A Lean Approach to Building Sustainable Quality Beyond Six Sigma shows how this tripartite approach can be used to add value to both large and small organisations through improved use of resources, and through the provision of improved customer satisfaction. It shows that a holistic approach to operational excellence underpinned by a data driven methodology can be applied equally to the manufacturing, service or public sectors. As the Six Sigma philosophy has evolved in recent years to take into account new challenges faced by companies, including climate change, green supply chain, emerging markets and a growing service sector, so FIT SIGMATM has also adapted itself to these new demands. FIT SIGMA: A Lean Approach to Building Sustainable Quality Beyond Six Sigma covers key developing areas including: Sustainability and Environment Non-profit organizations Service Operations Supply Chain Management Project Management Emerging Markets Small and Medium Enterprises Green Thinking Each chapter contains practical implementation guide, illustrative examples and case studies, and concludes with a summary of key elements for ease of reference and revision. In addition the book includes a comprehensive glossary of common terms and phrases used in managing quality, along with an appendix which illustrates the applications of basic statistics in Six Sigma and Fit Sigma.

There are many advantages associated with intradermal injections such as increased safety and reduced pain perception. To fully leverage these benefits there is a need to optimize old and new techniques to administer vaccines intradermally. The VAX-ID device will be able to administer several

preventive and therapeutic vaccines to children, adults and the elderly at different anatomic sites, e.g. the forearm. The European Union and the United States were chosen as the main target markets. As an introduction, the development process of innovative medical devices is shown to get a general overview of all elements at stake. The scope of the VAX-ID project is limited to the first three steps hereof: from research to pre-market clinical evaluation. The market analysis is the starting point of this thesis. In a next step, the value chain of the device was constructed and adoption factors critical to each player in this chain were identified. Finally, all this information was incorporated in the design of the business model. The market analysis includes an assessment of the competition within the industry by means of Porter's five forces framework and an overview of the external forces that have an impact on the industry by means of a PESTEL analysis. First of all, it became clear that the industry is hard to enter because high invested is required and products are protected by patents. Furthermore, there are several substitutes available in the market, out of which microneedle patches will pose the biggest threat in the future. With respect to the customers, a distinction was made between the direct customers, i.e. the vaccine manufacturers, and the end users, i.e. the healthcare providers and the patients. Both categories have significant power in deciding which devices they use. Therefore, this can also be considered as a threat. As far as the suppliers are concerned, there are high switching costs because they need to live up to high standards, e.g. with respect to sterility. Finally, the industry is characterized by intense rivalry and many companies are active in the intradermal injection market. Regarding the external forces, the political aspect was first of all investigated by looking into the healthcare systems in the European Union and the United States. In both continents, reforms are in order to keep the current policies sustainable, which leads to uncertainty for medical device developers. On an economic level, an unfavorable combination of economic slowdown and rising costs raises the question of who will pay for these expenses. This forces medical device developers to cut costs. With respect to the social aspect, several positive trends were discussed. Firstly, the population is growing bigger and older in the European Union and the United States, leading to more people requiring daily care. Furthermore, due to globalization clinical trials can be outsourced to cheaper destinations. Finally, the immunization policy in the European Union and the United States was examined. From a technological perspective, a culture of innovation is a critical success factor. Open innovation is a crucial element in the medical device industry allowing several parties to openly work together on the development of a new product. Next to this, it can be noted that due to the expansion of the internet and social media, patients are more informed and can be reached through new communication channels. As a medical device developer, it is important to embrace this trend. Lastly, 3D printing is a cost efficient and environmental friendly production technique that holds tremendous opportunities for the medical device industry. As for the ecological aspect, a growing emphasis is put on waste management. Finally, the legal environment can be considered risky since it is highly regulated. Overall, the medical device industry is hard to enter and prosper in. However, the opportunities on the social, technological and ecological level increase the chance of success as long as the threats are properly managed. In a second step, the value chain of the device was constructed in order to get an overview of the adoption factors that are important for all the stakeholders in the chain. The device will reach the healthcare providers through intermediaries (group purchasing organizations, wholesalers...), after which it is used to treat the patients. Apart from this, there are two other important actors in the value chain: the health technology assessment agencies, that influence legislation and evaluate new technologies, and the insurance agencies that partially or fully reimburse the treatment. For each of these stakeholders, several adoption factors that influence the

uptake of the device were identified. First of all, for device developers the legal framework is a determining factor. In this respect, the requirements to obtain market approval were looked into both for the European Union and the United States. The most important implication hereof was that in the European Union devices are often launched first due to less stringent regulations. Moreover, the risk and uncertainty levels of the project influence its chance of success. As a result, it is crucial to perform a thorough risk assessment focused on human blunders. Lastly, from the perspective of medical device developers, including cross-functional expertise and making room for social interactions positively impacts the outcome of the project. For health technology assessment and insurance agencies, the quality of the product plays a crucial role in their decision to adopt the device. To demonstrate the quality of the VAX-ID device, it was benchmarked against several intradermal injection techniques with respect to six criteria. This led to the conclusion that the features "compatibility with the vaccine" and "patient acceptability" should be leveraged as competitive advantages. Apart from the quality of the product, clinical evidence will support the adoption process of the device. As for the healthcare providers, the added value of the product is a significant factor as well as information and follow-up. It appears that when the benefits of an innovation are explicitly communicated to its users during the development process, the probability of adoption increases. Finally, to increase commercialization success it is of vital importance that the technology lives up to the patient's expectations. Human-centered design implies that the design of the device is adapted according to who uses the device and in what context it is used. For the VAX-ID project, many of these aspects were directly incorporated in the development of the device. Finally, the business model canvas tool was used to create the business model for the VAX-ID device. The canvas consists of nine building blocks and shows how value is created with a certain technology. The first part entails the identification of the customer segments. For the VAX-ID device, these are the vaccine manufacturers, healthcare providers and the patients. For each of these segments, a value proposition was formulated. Performance, cost reduction, risk reduction and usability are the main drivers of value with respect to the VAX-ID device. In a next step, the channels through which the customers will be reached were looked at and the relationships that need to be established were determined. If all these aspects match, this will lead to revenue streams. Key resources indicate which issues are necessary to be able to deliver the value proposition. In terms of the VAX-ID project, knowhow, partnerships and intellectual property are essential to reach our goals. After that, the key activities need to be spelled out. Evidentially these cannot be carried out alone, but partnerships are required. The VAX-ID project first and foremost relies on the parties primarily involved in the project. Other than BIR&D and Janssen Pharmaceuticals, we rely on the support of external parties such as patent lawyers and the government. When all these elements are described, the cost structure becomes clear. This way, a comprehensive overview is given on all the essential elements of the project. In the conclusion, all these insights were translated into practical managerial insights and suggestions for future research.

The Malawi Growth and Development Strategy II (MGDS-II) is a poverty reduction strategy for the period 2006–11, which is aimed at fulfilling Malawi's future developmental aspiration—Vision 2020. The strategy identifies broad thematic areas and key priority areas to bring about sustained economic growth. A striking feature of this strategy is that the various governmental organizations, private sector, and general public are equal stakeholders. However, successful implementation of MGDS-II will largely depend on sound macroeconomic management and a stable political environment.

Developing future strategies for a company is an important and complex task, and forms the core issue in this book. A company's strategy defines its future direction, specifying its desired market position and key competitive advantages both at the level of market offers and of resources. This book provides clear, straightforward advice for professionals: after a brief introduction to strategic planning, a heuristic process for determining future strategies is presented. It shows how to analyze a company's current situation, develop and assess options for the future, and define implementation projects. Throughout the book, detailed recommendations are illustrated with the help of numerous concrete examples. As a result of studying applications of the book in practice, the second edition benefits from a simplified, hands-on analysis and planning process at the business level.

Inhaltsangabe:Abstract: As electronic commerce is quickly increasing within some industries such as computers, software and retail banking the question arises whether and how insurance companies can profit too. This dissertation evaluates the impact of electronic commerce on the German insurance industry with the overall goal of creating competitive advantage. The dissertation proceeds by reviewing the literature for definitions and perspectives of electronic commerce, the suitability of electronic commerce for insurance products and services, the impact on existing business processes and value chains as well as the sources for creating competitive advantage within a mature insurance industry. Additionally, its organizational implications have also been examined. This dissertation contains fieldwork on the issues focused on in theory. Primary data was gathered using a questionnaire and a few interviews that were conducted with Chief Information Officers (CIO). The results of these activities were analysed and discussed by comparing them with both theory and experiences of other industries. Seminar paper from the year 2007 in the subject Business economics - Marketing, Corporate Communication, CRM, Market Research, Social Media, grade: B (67%), University of Sunderland, course: Marketing (Master), language: English, abstract: The world today is changing faster than ever. Technological developments, financial constraints, expanding markets, restructuring and mergers, new philosophies and government legislation are all putting pressure on organisations to change and stay dynamic (Davenport and Short, 1990; Aijo, 1996). This paper defines the external environment the private healthcare sector is facing in the USA, the world largest economy, and China, one of the biggest emerging markets and third largest trading nation in the world (bbp, 2005). According to Farnham (1999) the PEST-Analysis and Porter's (1980) five forces model provide a useful start for analysing the external environment. Building up on the information gathered it will be discussed what key challenges the private healthcare sector is facing, the significance of these challenges and how they might be overcome. Finally, it will be examined whether strategies of localisation or standardisation should be chosen in the USA and China, respectively.

Insurgence is designed to help business leaders apply new methods to the most important business problem they face in the world today: namely, how to overcome their incumbent mentality to maintain relevance and discover new sources of growth. At the convergence of lean, business model innovation, agile, and design thinking, *insurgence* is a methodology and business philosophy that will help leaders in incumbent businesses rediscover how to operate like small and nimble insurgents whilst maintaining many of their incumbent advantages. Incumbent businesses, often having enjoyed a long period of relative historical market stability, are increasingly unprepared for nimble insurgents coming on to the field of play and applying different assumptions and business models at speed and scale. These incumbent businesses find that the business models that fuelled their success are no longer robust to the change surrounding their business, and they are becoming increasingly obsolete, weighed down by a high degree of internal focus, inflexible internal controls, and an inability to innovate. Meanwhile, nimble insurgents strike at the heart of these weaknesses by formulating alternative core assumptions, building adaptive business models, and innovating in close proximity to customers and market needs. This book enables business leaders to characterise the difference between incumbents and insurgents, develop new ways of thinking about how to compete in this age of accelerating change, and provide a new framework for strategy and innovation that helps leaders to discover the essence of *insurgence* for their businesses. It uses rich case studies that illustrate both successful and unsuccessful efforts to help leaders move from theory to action at speed and at scale.
