European law is an increasingly important factor in the development and implementation of national and local health policy. Yet for many it remains shrouded in mystery. The situation with regard to laws impacting on health care is especially problematic as, typically, consequences arise from policies designed primarily to address problems in other sectors, which then establish general principles whose applicability to health care only becomes apparent once interpreted by rulings of the European Court of Justice. This book, written with the health and social policy community in mind, provides a comprehensive assessment of the main implications of EU law in certain key areas of health care.

The Defender of the Peace of Marsilius of Padua is a massively influential text in the history of western political thought. Marsilius offers a detailed analysis and explanation of human political communities, before going on to attack what he sees as the obstacles to peaceful human coexistence - principally the contemporary papacy. Annabel Brett's authoritative rendition of the *Defensor Pacis* was the first new translation in English for fifty years, and a major contribution to the series of Cambridge Texts: all of the usual series features are provided, included chronology, notes for further reading, and up-to-date annotation aimed at the student reader encountering this classic of medieval thought for

the first time. This edition of *The Defender of the Peace* is a scholarly and a pedagogic event of great importance, of interest to historians, political theorists, theologians and philosophers at all levels from second-year undergraduate upwards.

Timesaving Charts and Grids for Busy Teachers ActarBirkhauser The main objective of the report at hand was to gather available and authorized data, both published and unpublished, on the nutrition and health situation in the countries of the European Union (EU). Whereas the first report, released in 2004, included 13 EU member states and Norway, the 2009 edition covers 24 EU member states and Norway. For the collection of data, the researchers concentrated on the following points: The description of trends in food supply in the EU, focusing also on the different regions; the comparison of average daily individual food availability at household level; the evaluation of individual food consumption and energy and nutrient intake; the description of data on diet-related health indicators and status; and the analysis of food and nutrition policies in countries of the European Union. Throughout, the impact of age and gender is emphasized, and special attention is being paid to the different regions of the EU. The broad scope of the subjects covered and the improved quality of the data collected make the European Nutrition and Health Report 2009 an accurate documentation and sound source of information. Providing a basis for the work of the institutions responsible for health and nutrition policy, it is especially suitable for use in international comparisons of the nutrition and health situation.

This volume presents an overview of recent advances, innovative applications, and future prospects of in vitro embryogenesis in higher plants. The book's chapters are divided into five parts: Part I contains reviews on general topics (microspore; zygotic and somatic embryogenesis; in vitro and in vivo asexual embryogenesis; advances on the genetic, physiological, and proteomic knowledge of somatic embryo formation; role of apoptosis and mitochondria in somatic embryogenesis; and innovation in the use of bioreactors). The remaining four parts discuss step-wise protocols on somatic embryogenesis in selected horticultural plants (Part II); forest trees (Part III); gametic embryogenesis (Part IV); and pivotal topics, such as the detection of epigenetics modifications during microspore embryogenesis, the in vitro embryogenesis and plant regenerations from isolated zygotes, the synthetics seed production, the induction and maturation of somatic embryos, and the cryostorage of embryogenic cultures (Part V). Written in the highly successful *Methods in Molecular Biology* series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Authoritative and thorough, *In Vitro Embryogenesis in Higher Plants*, is a useful source of information and ideas for plant tissue culturists, cell biologists, embryologists, horticulturists, and operators of commercial nurseries. This book will introduce the fascinating work in in vitro embryogenesis in higher plants to students and young scientists.

Originally published in Italian in 1976, this book describes the methods scientists use to investigate the physical world. It is ideal for students and teachers of science and the philosophy of science. It is both a high-level popularization and a critical appraisal of these methods, describing important advances in physics and analyzing the historical development, value, reliability and philosophical implications of the way physicists approach the problems confronting them. The introductory chapter on the meaning of physical theories and the mathematical tools used to develop them is followed by a general discussion on the foundations of physics under four major headings: the physics of the reversible, the physics of the irreversible, microphysics, and cosmology. Throughout, the subject matter of physical theories is linked to discussion of the attendant philosophical and epistemological implications, such as the validity of the theories, inductive inference, causal explanation, probability, the role of observation and the reality of physical objects.

This book gives an overview of the most salient themes in present-day bioethics. The book focuses on perspectives typical for the European context. This highlights not only particular bioethical themes such as social justice, choices in health care, and health policy (e.g., in post-communist countries), it also emphasizes specific approaches in ethical theory, in relation to Continental philosophies such as phenomenology and hermeneutics.

Over the last two decades, interest in translation around the world has increased beyond any predictions. International bestseller lists now contain large numbers of translated works, and writers from Latin America, Africa, India and China have joined the lists of eminent, bestselling European writers and those from the global English-speaking world. Despite this, translators tend to be invisible, as are the processes they follow and the strategies they employ when translating. The Translator as Writer bridges the divide between those who study translation and those who produce translations, through essays written by well-known translators talking about their own work as distinctive creative literary practice. The book emphasises this creativity, arguing that translators are effectively writers, or rewriters who produce works that can be read and enjoyed by an entirely new audience. The aim of the book is to give a proper prominence to the role of translators and in so doing to move attention back to the act of translating, away from more abstract speculation about what translation might involve.

How do we learn to die? Most of us spend our lives avoiding that question, but this luminous book--a major best-seller in France--answers it with a directness and eloquence that are nothing less than transforming. As a psychologist in a hospital for the terminally ill in Paris, Marie de Hennezel has spent seven years tending to people who are relinquishing their hold on life. She tells the stories of her patients and their families. de Hennezel teaches us how to turn death--our loved ones' or our own--from something lonely and agonizing into a sacred passage. She discusses the importance of an honest reckoning, the value of ritual, the necessity of touch. In imparting these lessons, *Intimate Death* becomes a guide to living more fully, more intensely, than we had thought possible. "Unique...Of all the books I have read about the endings of our lives, this elegiac testimony has taught me the most."--Sherwin B. Nuland, M.D., author of *How We Die* "The quiet, obvious truths [de Hennezel] discovers in her work--these things have a kind of cumulative power."--Washington Post Book World From the Trade Paperback edition.

Considered an essential conservation tool, plant reintroductions have been conducted for many of the world's rarest plant species. The expertise and knowledge gained through these efforts constitute an essential storehouse of information for conservationists faced with a rapidly changing global climate. This volume presents a comprehensive review of reintroduction projects and practices, the circumstances of their successes or failures, lessons learned, and the potential role for reintroductions in preserving species threatened by climate change. Contributors examine current plant reintroduction practices, from selecting appropriate source material and recipient sites to assessing population demography. The findings culminate in a set of Best Reintroduction Practice Guidelines, included in an appendix. These guidelines cover stages from planning and implementation

to long-term monitoring, and offer not only recommended actions but also checklists of questions to consider that are applicable to projects around the world. Traditional reintroduction practice can inform managed relocation--the deliberate movement of species outside their native range--which may be the only hope for some species to persist in a natural environment. Included in the book are discussions of the history, fears, and controversy regarding managed relocation, along with protocols for evaluating invasive risk and proposals for conducting managed relocation of rare plants. *Plant Reintroduction in a Changing Climate* is a comprehensive and accessible reference for practitioners to use in planning and executing rare plant reintroductions.

Doctoral Thesis / Dissertation from the year 2009 in the subject Medicine - Biomedical Engineering, grade: none, University of Pisa (Faculty of Engineering), course: Bioengineering, language: English, abstract: Wearable sensors present a new frontier in the development of monitoring techniques. They are of great importance in sectors such as sport and healthcare as they permit the continuous monitoring of physiological and biological elements such as ECG and human sweat. Until recently this could only be carried out in specialized laboratories in the presence of cumbersome and often expensive devices. Sweat monitoring sensors integrated onto textile substrates are not only part of a new field of work but they also represent the first attempt to implement such an innovative idea on a system which will be worn directly on the body. The purpose of this dissertation is to present the design and creation of low cost, wearable, sweat rate and conductivity sensors integrated onto a textile.
