Data Visualisation is a way to interact with the data while Business Intelligence tools transform the data into meaningful visuals, reports, or dashboards that provide context for analysts to make business decisions. Data Visualization vs Business Intelligence | Learn Top 11 ... Data virtualization is an approach to data management that allows an application to retrieve and manipulate data without requiring technical details

about the data, such as how it is formatted at source, or where it is physically located, and can provide a single customer view of the overall data. Unlike the traditional extract, transform, load process, the data remains in place, and real-time access is given to the source system for the data. This reduces the risk of data errors, of the workload

Data virtualization - Wikipedia
Data Virtualization (DV) is a data integration technology for Business Intelligence. Although it has been around for more than 20 years, it is only now that more and more corporations are starting to use it as a workaround to Extract-Transform-Load (ETLs) and data warehousing in areas such as Business Intelligence Analytics (BIA), application development and Big Data.

Data Visualisation is a way to interact with the data while Business Intelligence tools transform the data into meaningful visuals, reports, or dashboards that provide context for analysts to make business decisions.
