Covalent bonds involve sharing electrons between atoms. When the atoms in the bond pull equally, the bonding electrons are shared equally, and the bond is nonpolar. When the atoms in the bond pull unequally, the bonding electrons are pulled closer to one atom, and the bond is polar. Chapter 8 - Covalent Bonding Chapter 8: Covalent Bonding. Matter takes many forms in nature: In this chapter, we are going to learn to distinguish the type of compound that we have already studied, the "ionic compound" (which contains oppositely-charged particles: metal cations and non-metal anions), from a

different type of compound - a "molecular compound".
