 some algebraic
 structures, specifically
 fields, rings, and groups:

Fields Definition: A field is
 a set with the two binary
 operations of addition and
 multiplication, both of
 which operations are
 commutative, associative,
 contain identity elements,
 and contain inverse

elements. Algebraic Structures - Fields, Rings, and Groups - Mathonline In algebra, a group ring is a free module and at the same time a ring, constructed in a natural way from any given ring and any given group. As a free module, its ring of scalars is the given ring, and its basis is one-to-one with the given group. As a ring, its addition law is that of the free module and its multiplication extends "by linearity" the given group law on the basis. Group ring - Wikipedia In mathematics, a field is a set on which addition, subtraction, multiplication, and division are defined and behave as the corresponding operations on rational and real numbers do. A field is thus a fundamental algebraic structure which is widely used in algebra, number theory, and many other areas of mathematics.. The best known fields are the field of rational numbers, the field of real ... Field (mathematics) - Wikipedia Every field is a ring, and every ring is a group. Groups, Rings, and Fields

Groups, rings, and fields are the fundamental elements of a branch of mathematics known as abstract algebra, or modern algebra. In abstract algebra, we are concerned with sets on whose elements we can operate algebraically; that is, we can combine two elements of the set, perhaps in several ways, to obtain a third element of the set.
