Pediatric Anxiety Disorders Oxford University Press  
This book draws on fields as diverse as biochemistry, physiology, pharmacology, psychology, psychiatry, and ethology, to form a fascinating synthesis of information on the nature of fear and of panic and anxiety disorders. Dr. Marks offers both a detailed discussion of the clinical aspects of fear-related syndromes and a broad exploration of the sources and mechanisms of fear and defensive behavior. Dealing first with normal fear, he establishes a firm, scientific basis for understanding it. He then presents a thorough analysis of the development, symptoms and treatment of fear-related syndromes. Phobic and obsessive-compulsive disorders are examined in detail. The book is illustrated with examples of fear and defensive behavior in other living organisms. By drawing provocative analogies between animal and human behavior, it sheds new light on the origins of fears, phobias, and obsessive-compulsive problems, as well as on their treatment by drugs and psychological means. Clinical psychologists, ethologists, and anyone interested in the mechanisms of behavior will be fascinated by this authoritative study. The text is intriguing and informative, and the bibliography of over 2,100 entries makes it an invaluable reference.

The experience of fear and stress leaves an indelible trace on the brain. This indelible trace is observed as both changes in behavior and changes in neuronal structure and function. Fear and stress interact on many levels. The experience of stress may lead to the formation of a fearful memory trace of a place or

reminder cue, and fearful memory formation is regulated by the extent of concurrent stress. The concurrent experience of fear and stress may amplify fear and slow fear extinction which may lead to pathology. Fear memory formation involves changes in synaptic plasticity while stress and glucocorticoids change neuronal structure. Thus, both neurons and synapses are changed. These changes can be identified, visualised and mapped within focused microcircuits. In this Research Topic we focus on current advances in both the neurobiology and behavioral consequences of fear and stress.

This book carries the Proceedings of the European Association for Behavioural and Cognitive Therapy conference held in Venice in September 1997 and is dedicated to the memory of Hans Eysenck. The EACBT conference provides a rare opportunity for a wide range of clinicians and researchers from all over Europe and the USSR to come together, resulting in a highly topical and valuable range of scientific presentations. The Proceedings comprises over twenty papers addressing key subjects in terms of behavioural and cognitive therapy including panic, affective disorders, paraphilia, schizophrenia, PTSD, obsession and other psychological disorders. Of particular interest are chapters on the use of cognitive behaviour therapy versus supportive therapy in

social phobia (Cottraux), the psychological treatment of paraphilias (De Silva), the theory and treatment of PTSD (Foa), the use of Diagnostic Profiling System in treatment planning (Freeman) and a cognitive theory of obsession (Rachman).

Most cases remain undiagnosed, and many of those which are diagnosed are treated inappropriately. Written by internationally renowned psychiatrist, Mario Maj, this book provides an update of research evidence and clinical experience concerning agoraphobia, social phobia and specific phobias.

The field of phenomenological psychopathology (PP) is concerned with exploring and describing the individual experience of those suffering from mental disorders. Whilst there is often an understandable emphasis within psychiatry on diagnosis and treatment, the subjective experience of the individual is frequently overlooked. Yet a patient's own account of how their illness affects their thoughts, values, consciousness, and sense of self, can provide important insights into their condition - insights that can complement the more empirical findings from studies of brain function or behaviour. The Oxford Handbook of Phenomenological Psychopathology is the first ever comprehensive review of the field. It considers the history of PP, its methodology, key concepts, and includes a section exploring individual experiences within schizophrenia, depression, borderline personality disorder, OCD, and phobia. In addition it includes chapters on some of the leading figures throughout the history of this field. Bringing together chapters from a global team of leading academics, researchers and practitioners, the book will be valuable for those within the fields of psychiatry, clinical psychology, and philosophy.

Oxford University Press

This Handbook surveys existing descriptive and experimental approaches to the study of anxiety and related disorders, emphasizing the provision of empirically-guided suggestions for treatment. Based upon the findings from the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), the chapters collected here highlight contemporary approaches to the classification, presentation, etiology, assessment, and treatment of anxiety and related disorders. The collection also considers a biologically-informed framework for the understanding of mental disorders proposed by the National Institute of Mental Health's Research Domain Criteria (RDoC). The RDoC has begun to create a new kind of taxonomy for mental disorders by bringing the power of modern research approaches in genetics, neuroscience, and behavioral science to the problem of mental illness. The framework is a key focus for this book as an authoritative reference for researchers and clinicians.

Mastering Your Fears and Phobias ABC-CLIO

Fears and Phobias reviews and synthesizes the different viewpoints of learning theory, psychoanalysis, ethology, and clinical psychiatry with regards to fears and phobias. The causes and treatment of phobias are examined, with due regard for relevant biological and psychological issues. Topics covered

range from the etiology of fear to clinical syndromes such as agoraphobic syndrome, animal phobias, social phobias, illness phobias, and obsessive phobias. Comprised of four chapters, this book begins with an overview of the historical aspects of phobias and the components of phobias, followed by a discussion on the etiology of fear. Experimental studies on fear that focus on innateness, maturation, and learning are examined, together with genetic aspects of timidity; the kinds of situations that are feared; and the physiology and learning of fear. The next chapter deals with clinical syndromes and the classification of phobic disorders such as the agoraphobic syndrome, specific animal phobias, and social phobias, along with illness phobias, obsessive phobias, autonomic equivalents to phobic disorders, and children's fears and phobias. The final chapter is devoted to prevention and treatment of phobias, including desensitization, and psychiatric management of phobic patients. This monograph will be of interest to psychiatrists and psychologists.
