given in minutes then change the units appropriately. Distance Word Problems (solutions, examples, videos)Distance word problems are a common type of algebra word problems. They involve a scenario in which you need to figure out how fast , how far , or how long one or more objects have traveled. These are often called train problems because one of the most famous types of distance problems involves finding out when two trains heading toward each other cross paths.Algebra Topics: Distance Word Problems - GCFCGlobal.org Solving for Distance, Rate, or Time . When you are solving problems for distance, rate, and time, you will find it helpful to use diagrams or charts to organize the information and help you solve the problem. You will also apply the formula that solves distance, rate, and time, which is $\text{distance} = \text{rate} \times \text{time}$. It is abbreviated as:Solving Problems With a Distance-Rate-Time FormulaIn fact, it's not so hard. This, like any distance and rate of travel problem, only requires one simple formula: $D = r \cdot t$; Distance traveled (D) is equal to your rate of speed (r) multiplied by the time (t) you traveled that speed. What makes most distance and rate

problems tricky is that you usually have two things traveling at once, so you need to use the formula twice at the same time. Algebra: Speed and Distance Problems When you read a problem that involves "how fast", "how far", or "for how long", you should think of the distance equation, $d = rt$, where d stands for distance, r stands for the (constant or average) rate

of speed, and t stands for time. Warning: Make sure that the units for time and distance agree with the units for the rate. "Distance" Word Problems - Purplemath Then the distance the first car traveled for 3 hours is equal to miles. Since the rate of the first car is 10 miles per hour greater than that of the second car, the rate of the second car is equal to miles per hour. Then the distance the second car

traveled for 3 hours is equal to miles. Lesson Travel and Distance problems - Algebra Distance problems are word problems that involve the distance an object will travel at a certain average rate for a given period of time. The formula for distance problems is: $\text{distance} = \text{rate} \times \text{time}$ or $d = r \times t$. Things to watch out for: Make sure that you change the units when

necessary. Distance Word Problems (solutions, examples) Distance rate time problems involves object moving at a constant rate and this is called uniform motion. The formula $d = r \times t$ is the formula to use to solve problems related to distance, rate, and time. More examples showing how to solve distance rate time problems I will show you how to solve 3 types of uniform

motion. Distance Rate Time Problems - Basic Mathematics Solution to Problem 7: Let x be John's rate in traveling between the two cities. The rate of Peter will be $x + 10$. We use the rate-time-distance formula to write the distance D traveled by John and Peter (same distance D) $D = 3x$ and $D = 2(x + 20)$ The first equation can be solved for x to give $x = D / 3$ Substitute x by $D / 3$ into

the second ...Rate, Time Distance Problems With Solutions So, if the person is increased by 50%, it will take 5 hrs 30 minutes to cover 330 miles distance. Problem 10 : ... Algebra word problems. Distance Rate Time Problems - Basic Mathematics

Make customizable worksheets about constant (or average) speed, time, and distance, in PDF or html formats. You

can choose the types of word problems, the number of problems, metric or customary units, the way time is expressed (hours/minute s, fractional hours, or decimal hours), and the amount of workspace for each problem.

ALGEBRA: SPEED AND DISTANCE PROBLEMS

Problems involving Time, Distance and Speed are solved based on one simple formula.

Distance = Speed * Time. Which implies \rightarrow Speed = Distance / Time and. Time = Distance / Speed. Let us take a look at some simple examples of distance, time and speed problems.

Example 1. A boy walks at a speed of 4 kmph. Then the distance the first car traveled for 3 hours is equal to miles. Since the rate of the first car is in 10 miles per hour greater than that of the second car, the rate of the second car is equal to miles per hour. Then the distance the second car traveled for 3 hours is equal to miles.
