All the talk about "open innovation" and externally-focused innovation assumes that "one size fits all" in terms of what network-centric innovation is and how companies should

harness external creativity. But the reality is that there is no one right way to master this tool. For instance, loosely governed community-based innovation projects are a very different animal from tightly-orchestrated development projects driven by a large firm. As the landscape of network-centric innovation becomes more diverse and more confusing, there is a desperate need to structure the landscape to better understand different models for network-centric innovation. This book brings clarity to the confusion. Further, it argues that managers cannot rely on anecdotal success stories they read about in the press to implement a network-

centric innovation strategy. They need rigorous and analytical advice on what role their company should play in an innovation network, what capabilities they need to create, and how they need to prepare their organization for this significant shift in the innovation approach. This book offers a practical and detailed roadmap for planning and implementing an externally-focused innovation strategy. Systems of record
(SORs) are engines
that generates value
for your business.
Systems of
engagement (SOE) are
always evolving and
generating new
customer-centric
experiences and new
opportunities to
capitalize on the value
in the systems of
record. The highest
value is gained when
systems of record and
systems of
engagement are
brought together to
deliver insight.
Systems of insight
(SOI) monitor and
analyze what is going

on with various
behaviors in the
systems of
engagement and
information being
stored or transacted in
the systems of record.
SOIs seek new
opportunities, risks,
and operational
behavior that needs to
be reported or have
action taken to
optimize business
outcomes. Systems of
insight are at the core
of the Digital
Experience, which tries
to derive insights from
the enormous amount
of data generated by
automated processes
and customer
interactions. Systems
of Insight can also
provide the ability to
apply analytics and
rules to real-time data
as it flows within,
throughout, and
beyond the enterprise
(applications,

databases, mobile, social, Internet of Things) to gain the wanted insight. Deriving this insight is a key step toward being able to make the best decisions and take the most appropriate actions. Examples of such actions are to improve the number of satisfied clients, identify clients at risk of leaving and incentivize them to stay loyal, identify patterns of risk or fraudulent behavior and take action to minimize it as early as possible, and detect patterns of behavior in operational systems and transportation that lead to failures, delays, and maintenance and take early action to minimize risks and costs. IBM® Operational Decision Manager is a decision

management platform that provides capabilities that support both event-driven insight patterns, and business-rule-driven scenarios. It also can easily be used in combination with other IBM Analytics solutions, as the detailed examples will show. IBM Operational Decision Manager Advanced, along with complementary IBM software offerings that also provide capability for systems of insight, provides a way to deliver the greatest value to your customers and your business. IBM Operational Decision Manager Advanced brings together data from different sources to recognize meaningful trends and patterns. It empowers business users to

define, manage, and automate repeatable operational decisions. As a result, organizations can create and shape customer-centric business moments. This IBM Redbooks® publication explains the key concepts of systems of insight and how to implement a system of insight solution with examples. It is intended for IT architects and professionals who are responsible for implementing a systems of insights solution requiring event-based context pattern detection and deterministic decision services to enhance other analytics solution components with IBM Operational Decision Manager Advanced.

IBM® MessageSight is an appliance-based messaging server that is optimized to address

the massive scale requirements of machine-to-machine (m2m) and mobile user scenarios. IBM MessageSight makes it easy to connect mobile customers to your existing messaging enterprise system, enabling a substantial number of remote clients to be concurrently connected. The MQTT protocol is a lightweight messaging protocol that uses publish/subscribe architecture to deliver messages over low bandwidth or unreliable networks. A publish/subscribe architecture works well for HTML5, native, and hybrid mobile applications by removing the wait time of a request/response model. This creates a better, richer user

experience. The MQTT protocol is simple, which results in a client library with a low footprint. MQTT was proposed as an Organization for the Advancement of Structured Information Standards (OASIS) standard. This book provides information about version 3.1 of the MQTT specification. This IBM Redbooks® publication provides information about how IBM MessageSight, in combination with MQTT, facilitates the expansion of enterprise systems to include mobile devices and m2m communications. This book also outlines how to connect IBM MessageSight to an existing infrastructure, either through the use of IBM WebSphere® MQ connectivity or the IBM Integration Bus

(formerly known as WebSphere Message Broker). This book describes IBM MessageSight product features and facilities that are relevant to technical personnel, such as system architects, to help them make informed design decisions regarding the integration of the messaging appliance into their enterprise architecture. Using a scenario-based approach, you learn how to develop a mobile application, and how to integrate IBM MessageSight with other IBM products. This publication is intended to be of use to a wide-ranging audience.
