Closed Loop Control System. The closed-loop control system means the output of the system depends on their input. The system has one or more feedback loops between its output and input. The closed-loop system design in such a way that they automatically provide the desired output by comparing it with the actual input. Difference Between Open Loop & Closed Loop System (with ... Control systems are classified into two types like open loop and closed loop. The main difference between open-loop and closed-loop control system is, the required output within the open loop doesn't depend on the controlled act whereas, in closed-loop, the required output mainly depends on the controlled act. Open Loop & Closed Loop Control System and Their Differences

The definition of a closed loop control system according to the British Standard Institution is "a control system possessing monitoring feedback, the deviation signal formed as a result of this feedback being used to control the action of a final control element in such a way as to tend to reduce the deviation to zero."

Any external disturbances to the closed-loop motor control system such as the

motors load increasing would create a difference in the actual motor speed and the potentiometer input set point. This difference would produce an error signal which the controller would automatically respond too adjusting the motors speed.
