A phasor is an "arrow" that we use to plot the current and voltage values on individual components of the circuit into a phasor diagram. Its magnitude reflects the amplitude of the voltage or current, and its direction indicates the phase angle. Drawing a phasor diagram for a series circuit: Series RLC Circuit — Collection of Solved Problems RLC Parallel circuit is the circuit in which all the components are connected in parallel across the alternating current source. In contrast to the RLC series circuit, the voltage drop across each component is common and that's why it is treated as a reference for phasor diagrams. RLC Parallel circuit analysis with solved problem A phasor diagram for a parallel alternating current circuit is drawn analogically to that for a series circuit. We must take into account that in a parallel

We know from above that the voltage has the same amplitude and phase in all the components of a parallel RLC circuit. Parallel RLC Circuit and RLC Parallel Circuit Analysis Instead of analysing each passive element separately, we can

combine all three together into a series RLC circuit. The analysis of a series RLC circuit is the same as that for the dual series R L and R C circuits we looked at previously, except this time we need to take into account the magnitudes of both  $X_L$  and  $X_C$  to find the overall circuit reactance. .
