Createspace Independent Publishing Platform
This book provides new insight on the problem of closed-loop performance and oscillations in discontinuous control systems, covering the class of systems that do not necessarily have low-pass filtering properties. The author provides a practical, yet rigorous and exact approach to analysis and design of discontinuous control systems via application of a novel frequency-domain tool: the locus of a perturbed relay system. Presented are a number of practical examples applying the theory to analysis and design of discontinuous control systems from various branches of engineering, including electro-mechanical systems, process control, and electronics. Discontinuous Control Systems is intended for readers who have knowledge of linear control theory and will be of interest to graduate students, researchers, and practicing engineers involved in systems analysis and design.

By the term frequency response, we mean the steady-state response of a system to a sinusoidal input. In frequency-response methods, we vary the frequency of the input signal over a certain range and study the resulting response. In this chapter we present frequency-response approaches to the analysis and design of control systems.The information we get from such analysis is different from what we get from root-locus analysis. In fact, the frequency response and root-locus approaches complement each other. One advantage of the frequency-response approach is that we can use the data obtained from measurements on the physical system without deriving its mathematical model. In many practical designs of control systems both approaches are employed. Control engineers must be familiar with both.

Technical Publications

This book is a systematic summary of some new advances in the area of nonlinear analysis and design in the frequency domain, focusing on the application oriented theory and methods based on the GFRF concept, which is mainly done by the author in the past 8 years. The main results are formulated uniformly with a parametric characteristic approach, which provides a convenient and novel insight into nonlinear influence on system output response in terms of characteristic parameters and thus facilitate nonlinear analysis and design in the frequency domain. The book starts with a brief introduction to the background of nonlinear analysis in the frequency domain, followed by recursive algorithms for computation of GFRFs for different parametric models, and nonlinear output frequency properties. Thereafter the parametric characteristic analysis method is introduced, which leads to the new understanding and formulation of the GFRFs, and nonlinear characteristic output spectrum (nCOS) and the nCOS based analysis and design method. Based on the parametric characteristic approach, nonlinear influence in the frequency domain can be investigated with a novel insight, i.e., alternating series, which is followed by some application results in vibration control. Magnitude bounds of frequency response functions of nonlinear systems can also be studied with a parametric characteristic approach, which result in novel parametric convergence criteria for any given parametric nonlinear model whose input-output relationship allows a convergent Volterra series expansion. This book targets those readers who are working in the areas related to nonlinear analysis and design, nonlinear signal processing, nonlinear system identification, nonlinear vibration control, and so on. It particularly serves as a good reference for those who are studying frequency domain methods for nonlinear systems.

## Introduction to Control Systems

Pearson Education India

This paper describes an analytical-graphical procedure which permits the closed loop frequency response of two-dimensional, non-linear, control systems to be evaluated. Amplitude and phase response, jump resonance and frequency entrainment are the characteristics which are predicted by this procedure. It is applicable to both symmetrical and non-symmetrical systems and restrictions do not have to be placed on the amplitudes and phase angles of the sinusoidal input signals. Describing functions are used to represent the responses of the non-linear elements. (Author).

**Analysis of Sampled-data Systems' Transient Response by the Frequency Response Method** World Scientific

Since the second edition of this classic text for students and engineers appeared in 1984, the use of computer-aided design software has become an important adjunct to the study of control system analysis and design. With this in mind the entire text has been recast, enlarged and updated. In addition the scope of the book has been extended so that it is suitable for students of mechanical and electrical engineering, as well as other students of control systems. Many of the classical analytical and graphical techniques have been retained because of their important conceptual role in understanding control system design, although the use of computer techniques in their application is encouraged and emphasized. The concept of a system S has been highlighted in the text, and various mathematical representations of it by the transfer function and State equation are carefully examined in early chapters. In discussing feedback control, the concept of robustness is introduced as a means of studying the effect of parameter variation upon system performance. Two new chapters on control strategies and plant sizing, and on adaptive control, have been added. The chapters on control system design, discrete time control, and non-linear control systems have been considerably expanded to cover such matters as pole-placement design using state space methods, digital compensators, and Popov stability methods of analysis. Dr D K Anand is both a Professor and Chairman of the Department of Mechanical Engineering at the University of Maryland, USA. Dr Anand has consulted widely in systems analysis for the US Government and for industry, and is a prominent author on control and engineering subjects. Dr R B Zmood is the Control Discipline Leader in the Department of Electrical Engineering at Royal Melbourne Institute of Technology, Australia. He has consulted widely both in Australia and in the USA on the industrial and military applications of control systems.
