Instructors are always faced with the dilemma of too much material and too little time. Perfect for the one-term course, *Precalculus with Calculus Previews, Fourth Edition* provides a complete, yet manageable, introduction to precalculus concepts while focusing on important topics that will be of direct and immediate use in most calculus courses. Consistent with Professor Zill's eloquent writing style, this four-color text offers numerous exercise

sets and examples to aid in students' learning and understanding, while graphs and figures throughout serve to illuminate key concepts. The exercise sets include engaging problems that focus on algebra, graphing, and function theory, the sub-text of so many calculus problems. The authors are careful to use the terminology of calculus in an informal and comprehensible way to facilitate the student's successful transition into future calculus courses. With an extensive Student

Study Guide and a full Solutions Manual for instructors, Precalculus with Calculus Previews offers a complete teaching and learning package! Applied Predictive Modeling covers the overall predictive modeling process, beginning with the crucial steps of data preprocessing, data splitting and foundations of model tuning. The text then provides intuitive explanations of numerous common and modern regression and

classification techniques, always with an emphasis on illustrating and solving real data problems. The text illustrates all parts of the modeling process through many hands-on, real-life examples, and every chapter contains extensive R code for each step of the process. This multi-purpose text can be used as an introduction to predictive models and the overall modeling process, a practitioner's reference handbook, or as a text for advanced undergraduate or graduate level predictive modeling

courses. To that end, each chapter contains problem sets to help solidify the covered concepts and uses data available in the book's R package. This text is intended for a broad audience as both an introduction to predictive models as well as a guide to applying them. Non-mathematical readers will appreciate the intuitive explanations of the techniques while an emphasis on problem-solving with real data across a wide variety of applications will aid practitioners who wish to

extend their expertise. Readers should have knowledge of basic statistical ideas, such as correlation and linear regression analysis. While the text is biased against complex equations, a mathematical background is needed for advanced topics.

Over the last twenty years or so, most of the work on the syntax of Philippine languages has been focused on the question of whether or not these languages can be said to

have grammatical subjects, and if so which argument of a basic transitive clause should be analysed as being the subject. Paul Kroeger's contribution to this debate asserts that grammatical relations such as subject and object are syntactic notions, and must be identified on the basis of syntactic properties, rather than by semantic roles or discourse functions. A large number of syntactic processes in Tagalog uniquely select the argument which bears the nominative case. On

the other hand, the data which have been used in the debate to assert the ambiguity of subjecthood are best analysed in terms of semantic rather than syntactic constraints. Together these facts support an analysis that takes the nominative argument as the subject. Kroeger examines the history of the subjecthood debate and uses data from Tagalog to test the theories that have been put forth. His conclusions entail consequences for certain linguistic concepts and theories, and lead

Kroeger to assert that grammatical relations are not defined in terms of surface phrase structure configurations, contrary to the assumptions of many approaches to syntax including the Government-Binding theory. Paul Kroeger is presently doing fieldwork in Austronesian languages and teaching linguistics to fieldworkers from around the world. *Produce News* The Mathematical Association of America The Phaedo is acknowledged to be one

of Plato's masterpieces, showing him both as a philosopher and as a dramatist at the height of his powers. For its moving account of the execution of Socrates, the *Phaedo* ranks among the supreme literary achievements of antiquity. It is also a document crucial to the understanding of many ideas deeply ingrained in western culture, and provides one of the best introductions to Plato's thought. This new edition is eminently suitable for readers new to Plato, offering a readable

translation which is accessible without the aid of a commentary and assumes no prior knowledge of the ancient Greek world or language. Pearson Higher Ed With new readings of ancient texts, *Ancient Maya Politics* unlocks the long-enigmatic political system of the Classic Maya.

Methods for the Determination of Metals in Environmental Samples

presents a detailed description of 13 analytical methods covering 35 analytes that may be present in a variety of sample types. The methods involve a wide range of analytical instrumentation including inductively coupled plasma (ICP)/atomic emission spectroscopy (AES), ICP/mass spectroscopy (MS), atomic absorption (AA) spectroscopy, ion chromatography (IC), and high performance liquid chromatography (HPLC). The application of these

techniques to such a diverse group of sample types is a unique feature of this book. Sample types include waters ranging from drinking water to marine water, in addition to industrial and municipal wastewater, groundwater, and landfill leachate. The book also includes methods that will accommodate biological tissues, sediments, and soils. Methods in this book can be used in several regulatory programs because of their applicability to many sample types. For

example, ICP/AES, ICP/MS, and AA methods can be used in drinking water and permit programs. Methods applicable to marine and estuarine waters can be used for the EPA's National Estuary Program. Terminology is consistent throughout the book, an important feature especially for the quality control sections where standardized terminology is not yet available. Methods for the Determination of Metals in Environmental Samples is an indispensable methods guide for all environmental

labs, wastewater labs, drinking water labs, lab managers, consultants, and groundwater engineers.

Common Sense Mathematics is a text for a one semester college-level course in quantitative literacy. The text emphasizes common sense and common knowledge in approaching

real problems through popular news items and finding useful mathematical tools and frames with which to address those questions. We asked ourselves what we hoped our students would remember about this course in ten year's time. From that ten year perspective thoughts about syllabus—"what topics should we cover?"—seemed much too narrow. What matters more is our wish to change the way our students' minds work—the way they approach a

problem, or, more generally, the way they approach the world. Most people "skip the numbers" in newspapers, magazines, on the web and (more importantly) even in financial information. We hope that in ten years our students will follow the news, confident in their ability to make sense of the numbers they find there and in their daily lives. Most quantitative reasoning texts are arranged by mathematical topics to be mastered. Since the mathematics is

only a part of what we hope students learn, we've chosen another strategy. We look at real life stories that can be best understood with careful reading and a little mathematics.

In our time nobody is content to stop with faith but wants to go further. It would perhaps be rash to ask where these people are going, but it is surely a sign of breeding and culture for me to assume that everybody has faith, for otherwise it would be queer for them to be . . . going further. In those old days it was different, then faith was a task for a whole lifetime, because it was assumed that dexterity in faith is not acquired in a few days or weeks. When the tried oldster drew near to his

last hour, having fought the good fight and kept the faith, his heart was still young enough not to have forgotten that fear and trembling which chastened the youth, which the man indeed held in check, but which no man quite outgrows. . . . except as he might succeed at the earliest opportunity in going further. Where these revered figures arrived, that is the point where everybody in our day begins to go further.

Fundamentals and Applications Simon and Schuster
Symmetries and asymmetries have always played an important role

in linguistic theorizing. From the early works on potentially universal properties of transformational processes, differences between rightward and leftward movement processes were noted and constituted a challenge to theories of conditions on transformations. The upward boundedness of extraposition rules vs. the successive cyclic character of question word movement, for example, remains a vexing problem. An idea which has gained

considerable prominence in the most recent syntactic work, in particular Noam Chomsky's 'Minimalist Program' and Richard Kayne's 'Antisymmetry' proposal, is that rightward movement simply does not exist. This means, in essence, that what looks like an element that has been moved rightward is either base-generated in its surface position, or it is actually moved leftward but all its surrounding materials have been moved leftward even further. Clearly, these

radical proposals have generated a large number of new analyses of the relevant phenomena, and they have fostered considerable controversy about the viability and desirability of this type of approach. The present volume brings together a representative group of articles discussing a variety of aspects of (apparent) rightward movement processes, including considerations having to do with parsing, and representing the various opposing lines of thought on this matter.

Empirically, they cover a wide array of constructions (extraposition, scrambling, quantifier-floating, etc.) and languages (American Sign Language, Bengali, Dutch, French, Frisian, German, Hindi, Japanese, Marathi, etc.).
