Conduction heat transfer only occurs in a medium. This is a distinction between conduction and radiation, which does not require a medium. The medium or state of matter in which conduction takes place can be a gas, liquid, or solid.

Transient Conduction of Heat in Solids with Infinite Thermal Conductivity $K \rightarrow \infty$ (Lumped Parameter Analysis): Solutions to the many of the transient heat flow problems are obtained by the lumped parameter analysis which presumes that the solid possesses infinitely large thermal conductivity. Internal conduction resistance is then so small that heat flow to or from the solid is controlled primarily by the convective resistance.

Conduction heat transfer in gases and liquids is due to the collisions and diffusion of the molecules during their random motion. On the other hand, heat transfer in solids is due to the combination of lattice vibrations of the molecules and the energy transport by free

electrons.

Conduction heat transfer:

definition, examples and applications

Heat can be transferred by conduction only in solids. If one end of a solid is heated, the particles of the solid gain kinetic energy. This means that they move faster.
