This allows the cloned fragment to be replicated upon transformation of the recombinant molecule into a bacterial cell (see Chapters 4 and 5) so that the DNA of interest can be investigated further. Cloning in Plasmid Vectors | SpringerLink Description. This animation describes a genetic engineering technique called DNA cloning, which can be used to make bacteria express a foreign gene, typically from another species. During DNA cloning, a new gene is inserted into a loop of bacterial DNA called a plasmid. As shown in the animation, the plasmid is first cut with a restriction enzyme so that the gene of interest, which is isolated from another organism, can be inserted into the loop.
