However, these types of systems require proper control to maintain efficiency and product quality. Closed Loop Control for Pneumatic Conveying - Process ... Closed-loop control compares the feedback position from the feedback device to a desired position. This error is multiplied by a proportional gain — a ratio that converts the error in position units to output in volts or milliamps. The greater the error, the higher the output must be to correct the error. On/off or closed-loop control? | Hydraulics & Pneumatics Closed-loop speed control of hydraulic motors We must know the load torque in an application to correctly predict the speed gain of the system.
