In *Learning with Information Systems* the author takes the developing world as the context and through a series of case studies develops a commonly used systems analysis methodology. He demonstrates how this methodology can evolve and adapt as new ideas become prominent. Issues of sustainability of information systems, participation in systems design and user ownership of systems are all examined. This book does not attempt to be prescriptive for all contexts nor does it focus on any particular technology. It addresses the essential questions and promises practical approaches which will help in the avoidance of the worst forms of disaster associated with the planning of information systems for developing countries.

Fishing vessels can be equipped with energy efficient refrigeration technology applying natural working fluids. Ammonia refrigeration systems have been the first choice, but CO2 units have also become increasingly common in the maritime sector in the last few years. When retrofitting or implementing CO2 refrigeration plants, less space on board is required and such

units allow good service and maintenance. Nowadays, cruise ship owners prefer CO2 units for the provision refrigeration plants. Ship owners, responsible for the health and safety of the crew and passengers, must carefully evaluate the usage of flammable low GWP working fluids, due to a high risk that toxic decomposition products are formed, even without the presence of an open flame. Suggestions for further work include a Nordic Technology Hub for global marine refrigeration R&D and development support for key components.

Refrigeration, air conditioning, and heat pumps (RACHP) have an important impact on the final energy uses of many sectors of modern society, such as residential, commercial, industrial, transport, and automotive. Moreover, RACHP also have an important environmental impact due to the working fluids that deplete the stratospheric ozone layer, which are being phased out according to the Montreal Protocol (1989). Last, but not least, high global working potential (GWP), working fluids (directly), and energy consumption (indirectly) are responsible for a non-negligible quota of greenhouse gas (GHG) emissions in the atmosphere, thus impacting climate change.

 The first comprehensive history of seventeenth-century London, told through the lives of those who experienced itThe Gunpowder Plot, the Civil Wars, Charles I’s execution, the Plague, the Great

Fire, the Restoration, and then the Glorious Revolution: the seventeenth century was one of the most momentous times in the history of Britain, and Londoners took center stage.In this fascinating account, Margarett Lincoln charts the impact of national events on an ever-growing citizenry with its love of pageantry, spectacle, and enterprise. Lincoln looks at how religious, political, and financial tensions were fomented by commercial ambition, expansion, and hardship. In addition to events at court and parliament, she evokes the remarkable figures of the period, including Shakespeare, Bacon, Pepys, and Newton, and draws on diaries, letters, and wills to trace the untold stories of ordinary Londoners. Through their eyes, we see how the nation emerged from a turbulent century poised to become a great maritime power with London at its heart—the greatest city of its time.
