RAIDEN RICE

NOAA's Role in Space-Based Global Precipitation Estimation and Application Hawksbill
Written for a broad audience this book offers a comprehensive

account of early warning systems for hydro meteorological disasters such as floods and storms, and for geological disasters such as earthquakes. One major theme is the increasingly important role in early warning systems played by the rapidly evolving fields of space and information technology. The authors, all experts in their respective fields, offer a comprehensive and in-depth insight into the current and future perspectives for early

warning systems. The text is aimed at decision-makers in the political arena, scientists, engineers and those responsible for public communication and dissemination of warnings.
THE RESULTS OF THE JAPANESE OCEANOGRAPHIC

PROJECT FOR THE INTERNATIONAL GEOPHYSICAL YEAR, 1957-58

National Academies Press

A hurricane is a tropical storm with winds that have reached a constant speed of 74 miles per hour or more. Hurricane winds blow in a large spiral around a relative calm centre known as the "eye." The "eye" is generally 20 to 30 miles wide, and the storm may extend outward 400 miles. As a hurricane approaches, the skies will begin to darken and winds will grow in strength. As a hurricane nears land, it can bring torrential rains, high winds, and storm surges. A single hurricane can last for more than 2 weeks over open waters and can run a path across the entire length of the eastern seaboard. August and September are peak months during the hurricane season that lasts from 1 June to 30 November. This book presents the facts and history of hurricanes.

ANNUAL REPORT OF THE WORLD METEOROLOGICAL ORGANIZATION

Bernan Press(PA)

Launched jointly in 1997 by the National Aeronautics and Space Administration (NASA) and the Japan Aerospace Exploration Agency (JAXA), the Tropical Rainfall Measuring Mission (TRMM) is a satellite mission that placed a unique suite of instruments, including the first precipitation radar, in space. These instruments are used to monitor and predict tropical cyclone tracks and intensity, estimate rainfall, and monitor climate variability (precipitation and sea surface temperature). TRMM has been collecting data for seven years; this data is used by the Joint Typhoon Warning Center, the National Center for Environmental Prediction, and the National Hurricane Center, among others worldwide. In July 2004, NASA announced that it would terminate TRMM in August 2004. At the request of the National Oceanic and Atmospheric Administration (NOAA), the White House, and the science community, NASA agreed to continue TRMM operations through the end of 2004. Meanwhile, NASA asked a National Research Council (NRC) committee to provide advice on the benefits of keeping TRMM in operation beyond 2004. After holding a workshop with a number of experts in the field, the committee found that TRMM will contribute significantly to operations and science if the mission is extended; and therefore, strongly

recommends continued operation of TRMM with the caveat that cost and risk will need to be further examined before a final decision about the future of TRMM can be made.

A very realistic geopolitical thriller, with all the elements of hybrid warfare, that begins with a murder. In Beijing, the delayed 22nd Communist Party Congress offers an opportunity to the PLA. The elite power brokers and party elders are unable to agree the new leadership line-up. The political stand-off starts fueling international tension surrounding Taiwan and the Diaoyu Islands. The PLA, taking advantage of the situation, seeks to bring matters to a head and resolve the Taiwan, South China Sea and Diaoyu island disputes by force. Or is it that simple? The ambition and designs of China create opportunities for others. In Mexico City, a multi-billionaire uses the conflict to further his ambitions for Mexico. In a diplomatic initiative with echoes of the 1917 Zimmermann Telegram, China makes a move to ensure Mexican and wider Latin American support for China. The implications dawn on a shocked America. As China unleashes its accumulated reserves of financial, economic and diplomatic power, will the debt-burdened and divided United States be able to respond? Will China's massive gold and foreign exchange reserves and its dominance in global trade and world GDP help it prevail? The US finds itself isolated in confronting China. The Pentagon's attempts to gain the upper hand display a hopeless misunderstanding of the nature of the challenge. As World War Three threatens, is conflict with China inevitable? The First Battle of the Philippine Sea was a decisive naval battle of World War II, which eliminated the Imperial Japanese Navy and decided the war. Will the Second Battle of the Philippine Sea be the decisive naval battle of World War III? In the tradition of all great naval battles both sides will try to inflict a strategic disaster on the other, while avoiding such a

fate themselves. Will victory favor the aggressive leadership and battle plan of the Americans or the conservative battle plan of the Chinese? As the crisis deepens and war looms, both sides field their latest technological secrets, in an unseen war in space and the cyber-sphere, as each seeks the virtual high ground in this prescient technothriller. Will we witness a reordering of the international hierarchy - the yielding of global hegemony - as an old empire attempts to replace the new and reclaim its rightful position? Is this fictional account of a clash between the United States and China - that has the unsettling qualities of a techno thriller deploying real and recognizable technical, financial, and military developments discernible today - what we can expect in 2032?

[Tropical Cyclone Intensity Analysis Using Satellite Data](#) Vintage
The National Oceanic and Atmospheric Administration (NOAA) uses precipitation data in many applications including hurricane forecasting. Currently, NOAA uses data collected from the Tropical Rainfall Measuring Mission (TRMM) satellite that was launched in 1997 by NASA in cooperation with the Japan Aerospace Exploration Agency. NASA is now making plans to launch the Global Precipitation Measurement (GPM) mission in 2013 to succeed TRMM, which was originally intended as a 3 to 5 year mission but has enough fuel to orbit until 2012. The GPM mission consists of a "core" research satellite flying with other "constellation" satellites to provide global precipitation data products at three-hour intervals. This book is the second in a 2-part series from the National Research Council on the future of rainfall measuring missions. The book recommends that NOAA begin its GPM mission preparations as soon as possible and that NOAA develop a strategic plan for the mission using TRMM experience as a guide. The first book in the series, *Assessment of the Benefits of Extending the Tropical Rainfall Measuring Mission* (December 2004), recommended that the TRMM mission be extended as long as possible because of the quality, uniqueness, and many uses of its data. NASA has officially extended the TRMM mission until 2009.

[Hurricane Watch](#) Springer Science & Business Media

The ultimate guide to the ultimate storms, Hurricane Watch is a fascinating blend of science and history from one of the world's foremost meteorologists and an award-winning science journalist. This in-depth look at these awe-inspiring acts of nature covers

everything from the earliest efforts by seafarers at predicting storms to the way satellite imaging is revolutionizing hurricane forecasting. It reveals the latest information on hurricanes: their effects on ocean waves, the causes of the variable wind speeds in different parts of the storm, and the origins of the super-cooled shafts of water that vent at high altitudes. Hurricane Watch is a compelling history of man's relationship with the deadliest storms on earth. Includes: - The story of the nineteenth-century Cuban Jesuit whose success at predicting the great cyclones was considered almost mystical. - A new look at Isaac Cline, whose infamous failure to predict the Galveston Hurricane left him obsessed with the devastating effects of storm surge. - The story of the Hurricane Hunters, including the first man ever to deliberately fly into a hurricane. - A complete account of how computer modeling has changed hurricane tracking. - A history of Project Stormfury: the only significant, organized effort to reduce the damaging strength of severe hurricanes. - A unique firsthand account of Hurricane Andrew by both authors, who were at the National Hurricane Center when Andrew struck. - A listing of the deadliest storms in history.

WMO Bulletin World Scientific

Cyclogenesis research is a central issue of meteorology and climatology. This book gives a deep specific view and fundamentally and effectively contributes to the discussion of the problem. It treats cyclogenesis as a stochastic process in a very fundamental way. Since the publication of the first edition of *Global Tropical Cyclogenesis* in 2001, a number of important scientific results has been obtained using methods and techniques proposed in that first edition. There is therefore a great need for a revised 2nd edition of this book. It is based on scientific findings from the performance of satellite data processing and a series of scientific marine expeditions to the tropics as part of major Russian Science Academy research projects. Professor Eugene A. Sharkov has proposed the main approaches, experimental techniques and theoretical explanations for many scientific findings as well as new methods of satellite processing. He is recognized as a leading scientist in the field of microwave remote sensing of terrestrial surfaces and atmosphere and in nonlinear geophysics (origination and evolution of atmospheric catastrophes) and has published around 100 scientific works on the problems of global tropical

cyclogenesis structure and evolution.

Oceanographical Magazine National Academies Press

This book, first published in 1983, is a compilation of some 50,000 acronyms and abbreviations used by the British, American, German and Soviet military. It enables the researcher to understand the language of the Armed Forces, their armaments and the related technology, and to reach a greater understanding of the capabilities and duties of the Armed Forces at the end of the Cold War. The Dictionary covers all the services and their technology, and is an indispensable reference work.

Hurricanes Springer

This volume, the second in the Lectures in Climate Change series, covers the full array of climate impacts and adaptation measures. It has been brought together by friends and colleagues of Dr Martin Parry, Co-Chair of the Intergovernmental Panel on Climate Change (IPCC) 2007 assessment on impacts and adaptation. The writers are experts in this field and have been lead authors in many of the IPCC assessments and other major publications. Lectures in Climate Change is a unique combination of written text plus electronic slides that together comprise an informative and up-to-date set of presentations. This second volume, entitled *Our Warming Planet: Climate Change Impacts and Adaptation*, covers areas of climate impacts related to climate science, methods and approaches, sectors, regional and national studies, and policy and practice. The volume comprises topics such as current and future challenges of climate change, global assessments, downscaling, community-based adaptation, impacts on biodiversity, food systems, water resources, and cities. Research from across the world is presented on making science actionable through assessments, early warning and early action, communicating climate risk, documenting the uptake of adaptation on the global front, and transformation towards systemic resilience. Included with this publication are downloadable electronic slides and accompanying notes of each lecture for students, teachers, and public speakers around the world to be better able to understand and present climate change impacts and adaptation.

Assessment of capabilities, needs of communities, opportunities and limitations of weather forecasting for coastal regions of Bangladesh Springer Nature

One of the core areas of study in civil engineering concerns water

that encompasses fluid mechanics, hydraulics and hydrology. Fluid mechanics provide the mathematical and scientific basis for hydraulics and hydrology that also have added empirical and practical contents. The knowledge contained in these three subjects is necessary for the optimal and equitable management of this precious resource that is not always available when and where it is needed, sometimes with conflicting demands. The objective of Fluid Mechanics, Hydraulics, Hydrology and Water Resources for Civil Engineers is to assimilate these core study areas into a single source of knowledge. The contents highlight the theory and applications supplemented with worked examples and also include comprehensive references for follow-up studies. The primary readership is civil engineering students who would normally go through these core subject areas sequentially spread over the duration of their studies. It is also a reference for practicing civil engineers in the water sector to refresh and update their skills.

The First Five Years 1961-1966 Springer Science & Business Media

This book explores how climate change and disaster risks threaten human security in Asia. Climate change and disaster risks have emerged as major human security challenges in the twenty-first century, and are an imminent "threat multiplier" with the potential to harm the vital core of human life and curtail people's freedom and ability to live with dignity. Climate change and disaster risks undermine the security of individuals, communities, nations, and the world, considering the increasing trend in the frequency and magnitude of hydro-meteorological disasters and the projections on their future adverse impacts. Despite recent advances in the literature, there is still a major gap in understanding the relationship and linkages between climate change, disaster risks, and human security, particularly as gleaned from the Asian experience. Asia is the world's most vulnerable region in terms of the quantity and magnitude of impacts from various forms of disaster. At the same time, it has developed a number of innovative responses to address those risks, offering a wealth of experience. Exploring and capitalizing on the Asian perspective, this book provides valuable resource material for students, academics, researchers, policymakers, and development practitioners working in these areas.

Japanese Contribution to the International Geophysical Year

1957/8 ESCAP/WMO Typhoon Committee Annual Review Typhoon Operational Experiment First Planning Meeting for TOPEXWMO Bulletin Application of Meteorology to Marine Interests Assessment of capabilities, needs of communities, opportunities and limitations of weather forecasting for coastal regions of Bangladesh

Epoch-making progress in meteorology and atmospheric science has always been hastened by the development of advanced observational technologies, in particular, radar technology. This technology depends on a wide range of sciences involving diverse disciplines, from electrical engineering and electronics to computer sciences and atmospheric physics. Meteorological radar and atmospheric radar each has a different history and has been developed independently. Particular radar activities have been conducted within their own communities. Although the technology of these radars draws upon many common fields, until now the interrelatedness and interdisciplinary nature of the research fields have not been consistently discussed in one volume containing fundamental theories, observational methods, and results. This book is by two authors who, with long careers in the two fields, one in academia and the other in industry, are ideal partners for writing on the comprehensive science and technology of radars for meteorological and atmospheric observations.

Japanese Contribution to the International Years of the Quiet Sun, 1964-1965 Routledge

Deadlock delays the start of the 22nd Communist Party Congress in Beijing, offering an opportunity for the PLA to usurp the power of their political masters and seize the initiative. Determined to end the perennial issues of the South China Sea, the Diaoyu/Senkaku Islands, and Taiwan, the PLA prepares to take matters into its own hands. The USS James K Polk CVN81, a Ford Class carrier, the centerpiece of a naval task force, is sent to

defend Taiwan. The outcome of the clash between the People's Liberation Army Navy and the US Navy will be pivotal in deciding subsequent events, as Beijing and Washington seek to force the other to back down. The First Battle of the Philippine Sea proved a decisive naval battle of World War II, which eliminated the Imperial Japanese Navy and decided the war. Will the Second Battle of the Philippine Sea be the decisive naval battle of World War III? In the tradition of all great naval battles both sides try to inflict a strategic disaster on the other. Will victory favor the aggressive leadership and battle plan of the Americans as they enter Beijing's Total Exclusion Zone or the conservative battle plan of the Chinese? As the crisis deepens and war looms, both sides field their latest technological secrets in an unseen battle below the Western Pacific and in the cyber-sphere, as each seeks tactical advantage. China: Showdown is a fast paced techno naval thriller in the spirit of The Hunt for Red October. The invocation of the latest technological developments is less speculation rather more the inevitable realization of weapons programs already in the works. For an insider's view of 21st century warfare, they do not come much more realistic than this.

WATER RESOURCES JOURNAL

Springer Science & Business Media

Water is vital for life. Since the dawn of civilization, much effort has been made to harness sources of fresh water. Recent years have raised global awareness of the need for increasing demand of water worldwide, largely because of growing population, rising standard of living, higher demand for energy, and greater appreciation for environmental quality. As an example, the world population has increased threefold in the past five decades. In order to meet the rising water demand, water resources are being

developed by building large dams, reservoirs, barrages and weirs across rivers worldwide. The guiding principle for water resources development has been to ensure adequate supply of water for agriculture, domestic use (including fine drinking water), waste disposal, industries, and energy production, with due attention to maintain the ecosystem functions. This development, however, depends on a holistic, cooperative and scientific approach. The basic inputs in the assessment of water resources for a given region are from hydrological data and the subject of hydrology forms the core in achieving sustainable development of water resources. Barring a few exceptions, hydrological data for most river basins are sparse and therefore it is difficult to comprehensively assess their water resources. The major source of water is rainfall which occurs as a result of condensation of atmospheric moisture governed by the science of meteorology. Radar for Meteorological and Atmospheric Observations Hawksbill This fully illustrated volume covers the history of radar meteorology, deals with the issues in the field from both the operational and the scientific viewpoint, and looks ahead to future issues and how they will affect the current atmosphere. With over 200 contributors, the volume is a product of the entire community and represents an unprecedented compendium of knowledge in the field.
