The fourth volume based on the annual University of Miami symposia on stress and coping, this new addition to the series is the first to focus on developmental and clinical stressors during infancy and childhood. While developmental stressors such as early separation and stranger anxiety, novelty stress, and fear-evoked personal distress, arise during normal development, clinical stressors result from certain conditions that are relatively common in infancy and early childhood such as premature birth and respiratory disease. Various therapies are discussed -- for

example, relaxation and massage -- that can alleviate the stress associated with psychiatric conditions in childhood and adolescence, including depression and adjustment disorder. The result is an integration of diverse research and theory on the psychophysiological, developmental, and psychosocial aspects of stress and coping in animals and humans by some of the leading researchers in the field.

Intersections With Attachment John Wiley & Sons

Biller, well known for his extensive research into the impacts of involved fathering or the absence thereof, provides a comprehensive, straightforward analysis of just how important paternal involvement really is. He describes the great advantages accruing to a child when the father, as well as the mother, actively participates in the parenting process. Fathers who sustain high interest and a true presence in a child's nurturing significantly influence body image, self-esteem, moral standards, intellectual achievement, and social competency. The benefits, Biller shows, extend beyond the father-child relationship and include heightened spousal satisfaction and a sense of overall family well-being. The reciprocal influences of father, mother, and child development, are considered within a lifespan biopsychosocial perspective. This is an important and compelling treatment of a topic of immense concern not only to individual families but to society as a whole. Biller, by relating specific issues to fathers' roles and influences, offers the first integrated analysis of just how important a father's caring presence and active involvement is to his child's--and spouse's--psychosocial well-being. This balanced study of paternal factors addresses not only such issues as nurturance, discipline, and the cultivation of

self-esteem, intelligence, and creativity but also family problems so evident in current society. There is a thorough analysis concerning complex connections among gender roles, parenting, and personality development. The work is highly substantive, realistic, and encouraging in its potential for guidance and offers insightful, useful conclusions on paternal behavior and influences.

Attachment has long been a key area of social development. Work on attachment processes has involved a variety of species as well as humans in diverse cultures and at various points in the life cycle. This volume presents research devoted to the meaning and implications of the attachment concept, including possible indices of attachment, the role of learning, whether or not attachment is best treated as continuous or discontinuous, and considerations for viewing attachment as a trait across environmental settings or as a process with functions that operate differently in disparate settings. Other psychological-process concepts, such as imprinting, relationships, and identification are also discussed. Because the contributors are active researchers and theorists, this volume may help establish trends and determine directions to shape literature on attachment for years to come.
