Light is a transverse, electromagnetic wave that can be seen by the typical human. The wave nature of light was first illustrated through experiments on diffraction and interference. Like all electromagnetic waves, light can travel through a vacuum. The transverse nature of light can be demonstrated through polarization. Such particles include things such as electrons, protons, and neutrons. Understanding the Quantum Nature of Light | UniversalClass Light is the narrow visible band of radiation in the broad continuous electromagnetic spectrum that ranges from radio waves to gamma rays. Its nature is complex as it transfers

energy, but has no mass. It travels at very high speeds (299,800,000 m/s in the vacuum of interstellar space). Light and the nature of seeing

The speed of light in a vacuum is a fundamental physical constant, the currently accepted value of which is exactly 299,792,458 metres per second, or about 186,282 miles per second.

light: The Nature of Light The scientific study of the behavior of light is called optics and covers reflection of light by a mirror or other object, refraction by a lens or prism, diffraction of light as it passes by the edge of an opaque object, and interference patterns resulting from diffraction. Also studied is the polarization of light.

This dual wave-like and particle-like nature of light is known as the wave-particle duality. The study of light, known as optics, is an important research area in modern physics.

Light - Wikipedia

Sunlight is the main source of our natural light. It is created by a range of different wavelengths of light radiating from the Sun. By definition, visible light is the part of the electromagnetic (EM) spectrum to which the human eye is sensitive. The visible wavelengths only include light that we can see.
