With the present Badgastein Symposium

"Radioactive Isotopes in Clinical Medicine and Research" we have now had 40 years of an uninterrupted series of Badgastein meetings on nuclear medicine, since the first one took place in January 1954. We believe that this anniversary is worth mentioning. The 21st symposium proved again to offer a representative cross section through the current topics of scientific interest of nuclear medicine. The general theme of research in nuclear medicine has shifted from the spectacular new developments which were so often reported in the first symposia to a less spectacular, albeit equally important period, which may best be characterized by validation and standardization. While this may not be as exciting as we would like it to be, it is nevertheless vital for nuclear medicine

to maintain and improve its standing amongst the other specialties of medicine which draw upon the services that nuclear medicine offers.

The adrenal gland is vitally important to health and secretes hormones that control many bodily processes ranging from normal metabolism to the response to stressful circumstances. The corticosteroid hormones are the basis for anti-inflammatory medicines and are very widely prescribed. Changes in the function of the adrenal gland, either naturally through stress or disease, or through the action of drugs and chemicals, can have a major impact on the body.; This text focuses on adrenal toxicity, examining how drugs and chemicals can directly and indirectly affect this gland. Coverage includes: classification of the types of adrenal and endocrine toxicity; the mechanistic and molecular basis of toxicity; reasons why

the adrenal is the most common target organ in the endocrine system; drug toxicity specific to patients with adrenal disorders; drug- corticosteroid interactions; adverse drug reactions; and how the adrenal gland is vital in tolerance to toxic insult.
