Also for Processors and Managers of Food Product Manufactories California Fruit News Official Gazette of the United States Patent and Trademark Office Patents Principles and Methods in the Canning of Fishery Products Canning is the most important factor in the fishery industry today, but information concerning the principles of canning fishery products has not been assembled, nor has a description of modern canning methods been previously available. This report is a reference handbook on problems in the commercial canning of fishery products. In addition to discussing

the scientific principles on which canning is based, it outlines the various engineering problems faced by the canner, and gives a detailed description of the methods used today in the commercial canning of 48 varieties of fish and shellfish packed commercially in hermetically sealed containers. Information on spoilage and methods used in the examination of fishery products is of use to the laboratory worker. The discussion on fishery products as food is of benefit to producers, brokers, dealers, food technologists, home economists, consumers, and all others interested in foods and their use. 2017 CFR Annual Print Title 15 Commerce and Foreign Trade Parts 300 to 799

A reconnaissance study has been made to determine the extent of pollution which results from the operation of a two-cycle outboard engine. Comparisons have been made of engine operation with and without a pollution control device attached. Studies have also been made of the biodegradability of the fuel and exhaust products. Tests made in a swimming tank with an untuned engine have shown that the quantity of fuel wasted as exhaust varied from about 7 percent of the volume of fuel used at high speeds, to over 30 percent at low speeds. For a recently tuned engine, the quantity of fuel discharged ranged from about 3 percent at high speeds to about 26 percent at low speeds.

When the Goggi pollution control device was installed, these quantities were intercepted and collected rather than discharged with the exhaust. Analyses at various depths indicated that nearly all products separated from the water in a short time and collected on the surface. Very little dissolved or emulsified oil was noted. Various analytical techniques were studied. Both fuel and exhaust products are capable of supporting microbial growth. Growth rates, however, appear to be limited by available oxygen.
