New Trends in the Age of Digital Change IGI Global

Information systems development is not merely a technical intervention but involves social and ethical dilemmas that

affect the human, social and organizational domains. To demonstrate this point, the authors conduct a thorough and substantive description and analysis of the conceptual and philosophical underpinnings of systems development. In particular they analyse a number of systems development methodologies including structured methods, prototyping, ETHICS and Soft Systems Methodology to reveal the underlying conceptual and philosophical foundations. The book provides an in-depth analysis of data modelling theory and its links with theories of language and cognition. It offers a framework to describe and analyse different systems development approaches and to explain their strengths and weaknesses. The book is aimed at graduate students taking courses in information systems and data modelling, but will also appeal to information systems managers and professionals for whom the summary of methodologies will be useful.

Due to such factors as poor economic conditions, climate change, and conflict, food security remains an issue around the world and especially in developing nations. Rapid changes in technology over the last decade has brought a renewed focus on how information and communication

technologies (ICTs) and application systems are deployed to improve rural competitiveness. Unfortunately, agricultural stakeholders in developing countries, particularly in Africa, have not been able to reap comparable benefits from adopting agricultural information systems as compared to their counterparts in the developed economies.

Understanding the challenges that hinder the effective adoption of agricultural information systems and identifying opportunities or innovations is imperative to improve the agricultural sectors and overcome the problems in these developing economies. Opportunities and Strategic Use of Agribusiness Information Systems is an essential reference book that examines the key challenges that hinder the effective adoption of agricultural information systems.

Moreover, it identifies and evaluates opportunities for the strategic deployment of ICTs and information systems to drive agricultural development for the benefit of agricultural sector stakeholders in emerging countries. While highlighting such topics as agricultural entrepreneurship, food value chain, and innovation systems, it is intended to provide sound and relevant frameworks and tools that will aid agricultural industry practitioners, smallholder farmers, and managers of agricultural extension systems looking to make more effective and responsible decisions when selecting, planning, deploying, and managing agribusiness information systems. It is additionally targeted for agricultural funding organizations, government policymakers, academicians, researchers, and students concerned with exploiting the potential of a variety of ICTs and information systems in the quest to achieve food security and poverty reduction in emerging economies.

Businesses must constantly adapt to a dynamically changing environment that requires choosing an adaptive and dynamic information architecture that has the flexibility to support both changes in the business environment and changes in technology. In general, information systems reengineering has the objective of extracting the contents, data structures, and flow of data and process contained within existing legacy systems in order to reconstitute them into a new form for subsequent implementation. Information Systems Reengineering for Modern Business Systems: ERP, Supply Chain and E-Commerce Management Solutions covers different techniques that could be used in industry in order to reengineer business processes and legacy systems into more flexible systems capable of supporting modern trends such as Enterprise Resource Planning (ERP), supply chain management systems and e-commerce. This reference book also covers other issues related to the reengineering of legacy systems, which include risk management and obsolescence management of requirements.

Information Technology and Product Development: A Research Agenda presents important new research from varied disciplines aimed at developing new theoretical concepts and insights on the application of IT in product and service innovation. Drawing on the work of researchers in such varied management areas as information services, technology management, marketing, operations, business strategy and organizational behavior, the book redefines the role of IT in product and service development and the organizational and management issues underlying the successful deployment of IT in innovation contexts, and provides a foundation for future research on the diverse types of IT applications in product development and their potential impact on both product and service innovation. Reflecting two critical shifts in the service sector – the increased complexity and convergence in products and services, along with the rise of the Internet and rapid digitization of products and services – the book is organized into three sections. Section 1 presents four chapters that focus on the traditional areas of project and process management; Section 2 presents four chapters focusing on the emerging areas of collaborative innovation and knowledge co-creation; and Section 3 presents one chapter that draws it all together and identifies some of the important themes and issues for future research. This important new work has much to offer academic researchers in management in its in-depth theoretical analysis of the wide range of organizational and management issues associated with the application of IT in product and service development. It will also appeal to researchers and thought-leaders in consulting organizations whose primary area of interest is product development or IT applications.

THE TRANSFER FROM DEVELOPERS TO OPERATIONS

Cambridge University Press

The concern of this book is how an organization's information resource may be identified, gathered, distributed,

protected and controlled; in short, how information may be managed. Such information literacy requires a coherent set of concepts through which to understand information systems and a flexible methodology through which those concepts may be applied to any factual situation. It is the contention of this book that both of these may be provided by soft systems thinking.
