An induction heater consists of an electromagnet and an electronic oscillator that passes a high-frequency alternating current through the electromagnet. The rapidly alternating magnetic field penetrates the object, generating electric currents inside the conductor, called eddy currents. The eddy currents flowing through the resistanceInduction heating - WikipediaInduction heating is a heat treating process that allows very targeted heating of metals by electromagnetic induction. The process

relies on induced electrical currents within the material to produce heat and is the preferred method used to bond, harden or soften metals or other conductive materials. In modern manufacturing processes, this form of heat treatment offers a beneficial combination of speed, consistency and control.Induction Heat TreatingInduction heating is a process which is used to bond, harden or soften metals or other conductive materials. For many modern manufacturing processes, induction heating offers an attractive combination of speed, consistency and control. The basic principles of induction heating have been understood and applied to manufacturing since the 1920s.Induction heating | Metallurgy for DummiesBut with induction heating, heat is actually "induced" within the part itself by circulating electrical currents. Induction heating relies on the unique characteristics of radio frequency (RF) energy - that portion of the electromagnetic spectrum below infrared and microwave energy. Since heat is transferred to the product via electromagnetic waves, the part never comes into direct contact with any flame, the inductor itself does not get hot (see Figure 1), and there is no product contamination.Induction Heating: What It Is, How it WorksInduction heating is a form of non-contact heating for conductive materials, when alternating current flows in the induced coil, varying electromagnetic field is set up around the coil, circulating current (induced, current, eddy current) is generated in the workpiece (conductive material), heat is produced as the eddy current flows against the resistivity of the material.Induction Heating Principle | Theory,What is induction ...To ensure repeatability and efficiency in the induction heating application, the rod heating was completed as a pre-programmed process with specific, well-defined steps. The currents that heat the material are induced by means of electromagnetic induction; it is a noncontact heating process. An induction coil above a conducting material (copper plate). What Is Induction Heating? - COMSOL Induction brazing is a process in which more materials are joined together by a filler metal that has a lower melting point than the base materials using induction heating. Annealing Induction Annealing is a metal heating treatment in which a metal material is exposed to an elevated temperature for an extended time and then slowly cooled.
