Building construction technology is concerned with the technical performance of buildings, building materials, and building construction systems. Technological progress has introduced many innovations in the field of construction industry. The building construction technology covers a wide range of modern techniques and practices that encompass the latest developments in materials technology and their applications, design procedures, quantity surveying, structural analysis and design, the functioning of components and systems, procedures and details of building assembly; operating strategies and so on. The adoption of advanced construction technology requires an appropriate design, commitment from the whole project team, suitable procurement strategies, good quality control, appropriate training and careful commissioning. There is a difference between new and old traditional construction methods. The use of machinery and automation has made its way through the civil engineering and construction industry. Most of the building components such as columns, roofs and concrete blocks are

available as prefabricated forms that increase the speed of construction process greatly. In the rapidly changing scenario of building sector, architects, engineers and builders should search for new construction technologies to adopt in future constructions that benefits like energy efficiency, resources and water conservation, improved indoor air quality, life cycle cost reduction, durability and low maintenance. Therefore, to attain these objectives, application and knowledge of latest advancements in various technologies are of prime concern. This book 'Advances in Building Construction Technology' contains six chapters which introduces various scientific methods and state-of-the-art building construction technologies and systems that may be beneficial to architects, engineers, building scientists and construction industry professionals.

This new textbook provides a comprehensive introduction to every aspect of the technology of low-rise construction. It includes sub-structure (site work, setting out and foundations) and superstructure (flooring, roofs, finishes, fittings and fixtures). The material here covers the first year course requirement of all courses on which construction technology is taught - no matter what the ultimate qualification. It offers tried and tested solutions to a range of construction problems and is organised following the sequence of construction. It will show what has been done in the past, demonstrating good practice - what works and what doesn't - and common faults. There are summaries of the more important BSI documents and reference to the latest building regulations. Lengthy explanations are avoided by relying heavily on hundreds of illustrations, pairing detail drawings with clear photographs to show real life construction situations.
