High-school student Yota Moteuchi is so unpopular that his classmates have given him the nickname "Dateless." So it's no surprise when the love of his life, Moemi, is not interested in Yota but instead is in love with Yota's best friend, Takashi. Yota turns to a video rental shop for comfort, but little did he suspect that the shop was magical and that the cute girl on his rented tape would pop out of the television and try to fix his ruined love life! Defective Video Girl When Ai falls in love with Yota-- emotions that are forbidden for Video Girls--Ai's creator recalls her tape completely! Yota must travel to the hazardous video world and battle physical and psychological hardship in order to prove his love for Ai.

Topics in Anti-Cancer Research covers new developments in the field of cancer. Novel drugs as anticancer agents include natural and synthetic phenazines and other anti-cancer compounds. It also encompasses the role of estrogen as endocrine disruptors and strategies targeting cancer stem cells for the treatment of different types of cancers, including myeloma and renal cell cancer. The diversity of researches and topics published in this eBook Series will be valuable to cancer researchers, clinicians, and cancer professionals aiming to develop novel anti-cancer targets for the treatment of various cancers. The topics covered in the eighth volume of this series are as follows: - Novel Drugs for Multiple Myeloma -Synthetic Estrogens are Endocrine Disruptors via Inhibition of AF1 Domain of ERs -Recent Progress of Phenazines as Anticancer Agents -Cancer Stem Cell Targeting for Anticancer Therapy: Strategies and Challenges

NSA is a comprehensive collection of international nuclear science and technology literature for the period 1948 through 1976, pre-dating the prestigious INIS database, which began in 1970. NSA existed as a printed product (Volumes 1-33) initially, created by DOE's predecessor, the U.S. Atomic Energy Commission (AEC). NSA includes citations to scientific and technical reports from the AEC, the U.S. Energy Research and Development Administration and its contractors, plus other agencies and international organizations, universities, and industrial and research organizations. References to books, conference proceedings, papers, patents, dissertations, engineering drawings, and journal articles from worldwide sources are also included. Abstracts and full text are provided if available.

Despite continuous progress in the development of anti-viral and anti-bacterial/parasite drugs, the high cost of medicines and the potential for re-infection, especially in high risk groups, suggest that protective vaccines to some of the most dangerous persistent infections are still highly desirable. There are no vaccines available for HIV, HCV and Malaria, and all attempts to make a broadly effective vaccine have failed so far. In this Research Topic we look into why vaccines have failed over the years, and what we have learn from these attempts. Rather than only showing positive results, this issue aims to reflect on failed efforts in vaccine development. Coming to understand our limitations will have theoretical and practical implications for the future development of vaccines to these major global disease burdens.

Volume 3 looks at classes of biomolecules including carbohydrates, nucleic acids, and lipids. In addition, special areas of application are included, such as pharmaceuticals, natural products, isotope ratio methods for biomolecules analysis, and clinical applications. The articles are arranged under general headings for continuity and ease of access, although several of these are of interest across the various disciplines. The articles are intended to teach and therefore strive to cover basics and sufficient additional detail to bring the reader up-to-date on a given subject. Some advanced topics are also covered, either in a special section of articles or in additional reading citations.

Regulation of immune system cell functions by protein kinase C

Frontiers Media SA
Members of the protein kinase C (PKC) family of Ser/Thr kinases are encoded by nine distinct but closely related genes, which give rise to more than 12 different protein isoforms via a mechanism of alternative RNA splicing. Most PKC proteins are ubiquitously expressed and participate in a plethora of functions in most cell types. A majority of PKC isoforms is also expressed in cells of the immune

system in which they are involved in signal transduction downstream of a range of surface receptors, including the antigen receptors on T and B lymphocytes. PKC proteins are central to signal initiation and propagation, and to the regulation of processes leading to immune cell proliferation, differentiation, homing and survival. As a result, PKC proteins directly impact on the quality and quantity of immune responses and indirectly on the host resistance to pathogens and tendency to develop immune deficiencies and autoimmune diseases. A significant progress was made in recent years in understanding the regulation of PKC enzymes, their mechanism of action and their role in determining immunocyte behavior This volume reviews the most significant contributions made in the field of immune cell regulation by PKC enzymes. Several manuscripts are devoted to the role of distinct PKC isoforms in the regulation of selected immunocyte responses. Additional manuscripts review more general mechanisms of regulation of PKC enzymes, either by post-translational modifications, such as phosphorylation or controlled proteolysis, or by interaction with different binding proteins that may alter the conformation, activity and subcellular location of PKC. Both types of mechanisms can introduce conformational changes in the molecule, which may affect its ability to interact with cofactors, ATP, or substrates. This topic will be followed by a discussion on the positive and negative impact of individual PKC isoforms on cell cycle regulation. A second section of this volume concentrates on selected topics relevant to role of the novel PKC isoform, PKC-theta, in T lymphocyte function. PKC-theta plays important and some non-redundant roles in T cell activation and is a key isoform that recruits to the immunological synapse - the surface membrane area in T cells that comes in direct contact with antigen presenting cells. The immunological synapse is formed in T cells within seconds following the engagement of the TCR by a peptide-bound MHC molecule on the surface of antigen-presenting cells. It serves as a platform for receptors, adaptor proteins, and effector molecules, which assemble into multimolecular activation complexes required for signal transduction. The unique ability of PKC-theta to activate the NF-kB, AP-1 and NF-AT transcription factors is well established, and recent studies contributed essential information on the mechanisms involved in the recruitment of PKC-theta to the center of the immunological synapse and the nature of its substrates and the role of their phosphorylated forms in signal transduction. Additional review manuscripts will describe the unique behavior of PKC-theta in regulatory T cells and its role in the regulation of other cell populations, including those of the innate immune response. This volume brings together leading experts from different disciplines that review the most recent discoveries and offer new perspectives on the contributions of PKC isoforms to biochemical processes and signaling events in different immune cell populations and their impact on the overall host immune response.

The rising demands in maintaining human wellness through diet have greatly promoted the interest in plant-based or vegetarian diets all over the world. Several government agencies, health/nutrition organizations, and health professionals are emphasizing that regular consumption of fruits and vegetables may provide health benefits and weight management. Fruits and vegetables are recognized as rich in nutritional components, such as fiber, protein, healthy fat, and micronutrients including vitamins, minerals, and phytochemicals. A growing body of scientific evidence supports that phytonutrients may play positive roles in preventing certain diseases, mainly aging-associated diseases. Furthermore, several benefits are associated with the consumption of vegetable-based fermented foods such as cereals, fruits and starchy root crops. It is noteworthy that microbial activity increases organic acids, decreases some toxic and anti-nutritional factors, and reduces amounts of sugars, resulting in a lower glycemic index. Microbial fermentation plays also a crucial role in safety traits of foods and beverages enhancing their sensory properties and extending their shelf life. Vegetable waste, which contains proteins, fats, natural colorants, enzymes, antimicrobials and antioxidants, represents a relevant source of natural food additives or supplements with high nutritional value. Furthermore, complex value-added chemicals such as phytochemicals, prebiotics, polysaccharides and polypeptides can be obtained via microbial, in an eco-friendly way. This Research Topic aims to present high-qualified scientific achievements on the impact of fruit, vegetable and/or novel plant based matrices on human health, sharing both successes and failures of original research and meta-analyses studies.

WHY VACCINES TO HIV, HCV AND MALARIA HAVE SO FAR FAILED - CHALLENGES TO DEVELOPING VACCINES AGAINST IMMUNOREGULATING PATHOGENS

This book aims to gather the current knowledge regarding different aspects of brain and spinal cord tumors in order to more efficiently help the patients. Brain tumors comprise about 5-9% of all human neoplasms; and the central nervous system (CNS) neoplasms are ranked among the most prevalent neoplasms of childhood as well. The more we know about the nature and characteristic of brain and spinal cord tumors, the more precise decision could be made for each patient, in order to reach the best outcome. While surgical resection, chemotherapy, and radiotherapy have been considered as the standards of care for benign and/or malignant CNS tumors since a long time ago, new therapeutic approaches such as immunotherapy have been recently proposed to be considered for treatment of CNS tumors, especially as in some cases, the tumors might be inoperable or the patient may not benefit from other treatment modalities after several recurrences. The second volume of the book focuses on clinical aspects of these tumors. Accordingly, the most important brain and spinal cord tumors are specifically discussed in each chapter based on a rational outlining for all chapter in this volume: Background and epidemiology, genetics, immunology and molecular biology, histopathology and morphology, imaging and radiologic features, clinical manifestations, therapeutic approaches, surgical intervention, chemotherapy and radiotherapy, new therapeutic modalities, follow-up, and prognosis. The chapters of this volume discuss the following pathologies of brain and spinal cord tumors: malignant glioma, benign glioma, meningiomas and other meningeal tumors, ependymomas, medulloblastomas, pineal tumors, choroid plexus and ventricular tumors, neuroectodermal tumors of CNS, neuroepithelial tumors of CNS, pituitary gland tumors, craniopharyngioma, schwannomas and nerve-sheath tumors, hemangioblastomas and other vascular originating tumors, brain and spinal tumors of embryonic origin, germ line cell tumors, malignant bone or cartilage-originating tumors of brain and spine, benign bone or cartilage-originating tumors of brain and spine, brain tumors affecting the orbit globe and orbit tumors affecting the brain, CNS lymphomas, metastatic lesions of the brain and spine, malignant spinal tumors, benign spinal tumors, brain and/or spinal cord tumors accompanied with other diseases or syndromes, psychological and psychiatric aspects of brain and spinal cord tumors, a brief explanation on surgical approaches for treatment of different brain tumors. This volume of book is useful for physicians of different specialties, mainly neurosurgeons, neurologists, neuropathologists, and neuroradiologists.

Plant reproduction is essential not only for producing offspring but also for increasing crop quality and yield. Moreover, plant reproduction entails complex growth and developmental processes, which provide a variety of opportunities for elucidating fundamental principles in biology. The combinational employment of molecular genetic approaches and emerging technologies, such as fluorescence-based imaging techniques and next generation sequencing, has led to important progresses in plant reproduction using model plants, crops, and trees. This e-book compiles 31 articles, including 1 hypothesis and theory, 4 perspectives, 12 reviews, and 14 original research papers. We hope that this E-book will draw attention of all plant biologists to exciting advances in the field of plant reproduction and help solve remaining challenging questions in the future. We wish to express our appreciation to all the authors, reviewers, and the Frontiers editorial office for their excellent contributions that made the publication of this e-book possible.

Survival, the IISS's bimonthly journal, challenges conventional wisdom and brings fresh, often controversial, perspectives on strategic issues of the moment. In this issue: Gigi Kwik Gronvall examines the contested origin of SARS-CoV-2 and argues that scientific work should be apolitical and globally cooperated, including with China Lawrence Freedman contends that while liberalism is in crisis, it should still be better than authoritarianism at adapting to new circumstances, acknowledging salient problems and choosing among alternatives Robert S. Ross argues that Chinese strategists believe Beijing can challenge a strategically weakened United States on the Korean Peninsula Ondrej Rosendorf, Michal Smetana and Marek Vranka assess that persuading the public that nuclear abolition is feasible could strengthen disarmament advocacy And nine more thought-provoking pieces, as well as our regular Book Reviews and Noteworthy column. We are delighted to present the Frontiers in Oncology "Women in Breast Cancer" Volume II series of article collections. At present, less than 30% of researchers worldwide are women. Long-standing biases and gender stereotypes are discouraging girls and women away from science-related fields, and STEM research in particular. Science and gender equality are, however, essential to ensure sustainable development as highlighted by UNESCO. In order to change traditional mindsets, gender equality must be promoted, stereotypes defeated, and girls and women should be encouraged to pursue STEM careers.

Discover all the mysteries, facts, and discoveries about ghosts that are creepy—and true—in the much-anticipated companion to *Mummies Exposed!* Do you believe in ghosts? Whether you're a believer in things that go bump in the night or a firmly science-minded skeptic, there is compelling evidence to suggest that the veil between the living and the dead may be thinner than we think. *Ghosts Unveiled!* investigates spectral appearances, unsolved mysteries, and eerie hauntings around the world: the Vanishing Hitchhiker, the child-nabbing La Llorona, demon cats and dogs, haunted schools, and even wraiths in bathrooms! Examining eyewitness accounts from both contemporary interviews and historical records as well as physical signs of paranormal activity, this meticulously researched, well-balanced, and spine-tingling book will leave you wondering what is truly beyond the veil. The *Creepy and True* series explores strange phenomena, fun facts, and out of the ordinary discoveries. Read them all to uncover the creepy and true histories of mummies, ghosts, skeletons, and more!
