EXPERIMENT 4 CHEMICAL KINETICS Introduction Chemical kinetics studies how fast reactants change into products in a chemical reaction. It focuses on the reaction rate of an equation, the change in the amount of reactants or products over time. The rate varies between reactions and is determined from the nature of the reactants. Reactions such as explosions and the ripening of fruit occur over a different range of time. Lab 4 Report - EXPERIMENT 4 CHEMICAL KINETICS Introduction ... The reaction to be studied in this experiment is represented by the following balanced chemical

equation: $6\text{I}^- (\text{aq}) + \text{BrO}_3^- (\text{aq}) + 6\text{H}^+ (\text{aq}) \rightarrow 3\text{I}_2 (\text{aq}) + \text{Br}^- (\text{aq}) + 3\text{H}_2\text{O} (\text{l})$ This reaction proceeds relatively slowly. The rate law for this reaction is of the form: $\text{Rate} = k[\text{I}^-]^x[\text{BrO}_3^-]^y[\text{H}^+]^z$. 1: Chemical Kinetics - The Method of Initial Rates ... Chemical kinetics deals with the speed, or rate, of a reaction and the mechanism by which the reaction occurs. We can think of the rate as the number of events per unit time. The rate at which you drive (your speed) is the number of miles you drive in an hour (mi/hr). For a chemical reaction the rate is the number of moles that react in a second.
