Dairy science includes the study of milk and milk-derived food products, examining the biological, chemical, physical, and microbiological aspects of milk itself, as well as the technological (processing) aspects of the transformation of milk into its various consumer products, including

beverages, fermented products, concentrated and dried products, butter and ice cream. This encyclopedia includes information on the possible impact of genetic modification of dairy animals, safety concerns of raw milk and raw milk products, peptides in milk, dairy-based allergies, packaging and shelf-life and other topics of importance and interest to those in dairy research and industry. The Encyclopedia of Dairy Sciences is the only work available that covers in detail the entirety of dairy science, from husbandry of dairy animals, milk production, through the processing of milk into a myriad of dairy products and ingredients, to the effect of dairy foods on human health. The third edition of Encyclopedia of Dairy Sciences will retain the split that characterized the earlier editions - one-third primary production, two-thirds dairy food. Unlike earlier editions, in which articles were arranged in alphabetical order by topic, this edition will be optimally organized into 9 coherent sections. This new edition contains 500 articles, the vast majority of which has been significantly revised or is completely new. Only 40 chapters have been retained from the earlier edition as they cover basic science areas still relevant and important today. All articles have been reviewed by specialists in their area. Comprehensive and authoritative introductory articles on all aspects of dairy science from on-farm aspects, to processing, to consumers Content is written and edited by leading authorities from across the globe making this the go-to foundational reference in the dairy science community Articles are intuitively and meticulously organized into 9 coherent sections on key topics, making it easier for the reader to access relevant information quickly

The Cambridge Encyclopedia of Human Paleopathology is a major reference work for all those interested in the identification of disease in human remains. Many diseases leave characteristic lesions and deformities on human bones, teeth and soft tissues that can be identified many years after death. This comprehensive volume includes all conditions producing effects recognizable with the unaided eye. Detailed lesion descriptions and over 300 photographs and diagrams facilitate disease recognition and each condition is placed in context with discussion of its history, antiquity, etiology, epidemiology, geography, and natural history. Uniquely, diseases affecting the soft tissues are also included as these are commonly present in mummified remains.

More than 1,000 representations of the human figure in architectural drawings by architects ranging from Aalto to Zumthor, removed from their architectural context. Michael Meredith, Hilary Sample, and MOS present their rich findings on the human presence in architectural drawings not in any chronological or other linear order, but based on the convention of the encyclopedia, thus presenting (and perhaps deliberately condoning) surprise encounters made possible by the contingency created by alphabetical order..... From the contemporary perspective of a pluralistic world, the form of the encyclopedia may be particularly apt to represent such a vast body of material as is presented here: defying any linear historical account or master narrative, it invites the reader to construct his or her own readings of the material by establishing relationships between individual drawings. —From the foreword by Martino Stierli Throughout history, across radically different movements in Western culture, the human figure appears and reappears, in multiple guises, to remind us, the observers, of architectural purpose and of our mutual position in the world....This encyclopedia has enlarged or reduced all figures to the same approximate scale. Meredith, Sample, and MOS have gathered them here in an unprecedented, intoxicating way, like being at a fabulous party. —From the afterword by Raymund Ryan Architects draw buildings, and

the buildings they draw are usually populated by representations of the human figure—drawn, copied, collaged, or inserted—most often to suggest scale. It is impossible to represent architecture without representing the human form. This book collects more than 1,000 scale figures by 250 architects but presents them in a completely unexpected way: it removes them from their architectural context, displaying them on the page, buildingless, giving them lives of their own. They are presented not thematically or chronologically but encyclopedically, alphabetically by architect (Aalto to Zumthor). In serendipitous juxtapositions, the autonomous human figures appear and reappear, displaying endless variations of architecturally rendered human forms. Some architects' figures are casually scrawled; others are drawn carefully by hand or manipulated by Photoshop; some are collaged and pasted, others rendered in charcoal or watercolors. Leon Battista Alberti presents a trident-bearing god; the Ant Farm architecture group provides a naked John and Yoko; Archigram supplies its Air Hab Village with a photograph of a happy family. Without their architectural surroundings, the scale figures present themselves as architecture's refugees. They are the necessary but often overlooked reference points that give character to spaces imagined for but not yet occupied by humans. Here, they constitute a unique sourcebook and an architectural citizenry of their own.

"The discovery of the first species of African hominin, *Australopithecus africanus*, from Taung, South Africa in 1925, launched the study of fossil man in Africa. New discoveries continue to confirm the importance of this region to our understanding of human evolution. Outlining major developments since Raymond Dart's description of the Taung skull and, in particular, the impact of the pioneering work of Phillip V. Tobias, this book will be a valuable companion for students and researchers of human origins. It presents a summary of the current state of palaeoanthropology, reviewing the ideas that are central to the field, and provides a perspective on how future developments will shape our knowledge about hominin emergence in Africa. A wide range of key themes are covered, from the earliest fossils from Chad and Kenya, to the origins of bipedalism and the debate about how and where modern humans evolved and dispersed across Africa"--

With more than sixty essays written by an international group representing the leading scholars in the field, this is the definitive work on Darwin. It covers the background to Darwin's discovery of the theory of evolution through natural selection, the work he produced and his contemporaries' reactions to it, and evaluates his influence on science in the 150 years since the publication of *Origin of Species*. It also explores the implications of Darwin's discoveries in religion, politics, gender, literature, culture, philosophy, and medicine, critically evaluating Darwin's legacy. Fully illustrated and clearly written, it is suitable for scholars and students as well as the general reader. The wealth of information it provides about the history of evolutionary thought makes it a crucial resource for understanding the controversies that surround evolution today.

Volume 1 in the new Cambridge World History of Slavery surveys the history of slavery in the ancient Mediterranean world. Although chapters are devoted to the ancient Near East and the Jews, its principal concern is with the societies of ancient Greece and Rome. These are often considered as the first examples in world history of genuine slave societies because of the widespread prevalence of chattel slavery, which is argued to have been a cultural manifestation of the ubiquitous violence in societies typified by incessant warfare. There was never any sustained opposition to slavery, and the new religion of Christianity probably reinforced rather than challenged its existence. In twenty-two chapters, leading scholars explore the centrality of slavery in ancient Mediterranean life using a wide range of textual and material evidence. Non-specialist readers in particular will find the volume an accessible account of the early history of this crucial phenomenon.

Palaeopathology is designed to help bone specialists with diagnosis of diseases in skeletal assemblages. It suggests an innovative method of arriving at a diagnosis in the skeleton by applying what are referred to as 'operational definitions'. The aim is to ensure that all those who study bones will use the same criteria for diagnosing disease, which will enable valid comparisons to be made between studies. This book is based on modern clinical knowledge and provides background information so that those who read it will understand the natural history of bone diseases, and this will enable them to draw reliable conclusions from their observations. Details of bone metabolism and the fundamentals of basic pathology are also provided, as well as a comprehensive and up-to-date bibliography. A short chapter on epidemiology provides information on how best to analyze and present the results of a study of human remains.
