(Siemens/meter) Mysteries of the Smith Chart - FARSI
 In RF-power transistors the input impedance is of low value, decreasing as the power increases, or as the chip size becomes larger. This impedance must be matched either to a generator — of generally 50 ohms internal impedance — or to a preceding stage. Impedance transformation ratios of 10 or even 20 are not rare.
 AN721: Impedance Matching Networks Applied to RF Power ...It can be shown

mathematically that any source of power e.g. a receiver antenna, an audio amplifier or an amateur radio transmitter will deliver its maximum possible power output when the impedance of the subsequent load is equal to the internal impedance of that source. This is achieved through impedance matching.
