Lippincott Williams &  
 Wilkins  
 This textbook  
 comprehensively covers

mechanical ventilation in  
 neonates and children  
 integrating the latest  
 knowledge and  
 understanding of  
 developmental biology,

age-related and disease-specific physiologic differences in the practice of mechanical ventilation. The physiology associated with ventilation and lung mechanics are described. Guidance is provided on how to carry out a range of clinical assessments appropriately, including those for ventilation, mechanics and breathing control. Available pathophysiology-based management strategies for a range of situations including respiratory failure and ventilatory failure are also provided. Mechanical Ventilation in Neonates and Children: A Pathophysiology Based Management Approach broadly covers a range of topics associated with mechanical ventilation in children and neonates. It is a valuable resource for specific seminars or courses that concentrate on respiratory failure in children and for those preparing for board certification examinations for neonatal/perinatal medicine and pediatric critical care medicine.

**Workbook in Practical Neonatology** Saunders

Sixty percent of the epilepsies start in childhood, and most of the clinically significant and often life-changing aspects of the disease

occur at this time. Childhood epilepsy is frequently a complex disorder, demanding integrated medical, educational and community services. Its treatment encompasses acute and disability medicine. The many types or syndromes of childhood epilepsy present both diagnostic and management challenges. Although many children with epilepsy will be referred to specialist units, the majority will initially present to paediatricians and paediatric neurologists. This book provides a practical, problem-oriented manual to help clinicians with diagnosis, evaluation and management. This book addresses epilepsy as an evolving disorder from presentation, through active disease and finally to either spontaneous remission or a chronic lifelong condition. Structured on the child's age at presentation, Childhood Epilepsy offers a practical overview for paediatricians, paediatric neurologists and primary care practitioners who treat children with epilepsy in their daily practice.

Gambling Disorders in Women

This book provides a practical guide to the management of secondary symptoms commonly seen in patients suffering from advanced cancer, AIDS, and other terminal diseases. Drawing on a vast body of knowledge about the causes of specific symptoms and what works best to relieve them, the book issues expert advice on the steps to follow when evaluating patients and finding ways to improve their comfort and quality of life. Emphasis is placed on the need for individual treatment plans that take into account

psychological, social, and spiritual aspects as well as physical problems. While many of the approaches described are drug-based, non-drug measures, which are often simple to implement and can provide substantial relief, are also covered in detail. The book has 15 concise chapters. General principles of patient evaluation and management are outlined in the first, which lists routine questions to be asked when evaluating the nature and severity of a symptom and explains the principles of treatment for both non-drug measures and drug therapies. The remaining chapters, which form the core of the guide, focus on 14 common symptoms, moving from anorexia, anxiety, and asthenia, through constipation, nausea, and vomiting, to skin problems and urinary symptoms. Complaints such as cough and hiccup, which can give rise to considerable discomfort in the terminally ill patient, are also considered. Each symptom is covered according to a common approach, which outlines possible causes, describes the steps to follow during evaluation, and explains how to select and implement the best

treatment option. Details range from a five-step plan for the management of uncomplicated constipation, through alerts to cases where inappropriate treatments may be harmful or dangerous, to advice on the types of food that are particularly likely to precipitate nausea. For drug therapies, information includes recommended drugs, doses, and modes of administration, together with advice on special side effects and other problems that may arise in the terminally ill patient. The book complements information contained in the standard WHO guide "Cancer Pain Relief: with a Guide to Opioid Availability" which is now in its second edition. Pain management is therefore not covered in the present work.
