Following the original initiative of the International Organisation for Biological Control some 15 years ago, research groups and agrochemical companies have been investigating the effects of pesticides on beneficial organisms, devising laboratory and field test methods and lately developing protocols for regulatory testing requirements in Europe. This work, and the application of agreed protocols for testing, is of crucial importance to the environmentally acceptable use of pesticides and to the further development of Integrated Pest Management systems, and the objective of this book is to review the origins and progress of the research - what has been accomplished, what is the current position and what still needs to be done.

Biocontrol is among the most promising methods for a safe, environmentally benign and sustainable pest control. Microbial pesticides offer a great potential, and it is anticipated that they will become a substantial part of the use of all crop protection products. Their development and commercialization, however, has been difficult and with many failures. In this book a rational and structured roadmap has been designed for the development and commercialization of microbial pest control products for the control of arthropod pests. The building blocks of the entire process are identified and essential aspects highlighted. Biopesticides based on entomopathogenic bacteria, fungi, viruses and nematodes are elaborately discussed. This systematic roadmap with a strong focus on economics and market introduction will assist academic researchers and industrial developers of biopesticides in accomplishing their goal: the development of successful cost-effective microbial pesticides.

Biotechnological research has provided key developments in pest control agents, focusing on pathogens of insect pests as formulated biological pesticides. Emphasis has been placed on bacteria and viruses as they are well understood and easily manipulated. Microbial Biopesticides provides a comprehensive overview of the advances made in the use of b

It was our intention and goal to bring together m Biopesticides Use and Delavery the latest advances in the science and technology of the evolving field of biopesticides In the context of crop protection, btopesticides are a key component of integrated pest management (IPM) programs, m which biopesticides are delivered to crops m inundative quantities, vs the mocu- tive approach, which is charactertstic of classical biological control. Although there are several definitions of biopesticides m the literature, we chose to define them as either microbials themselves or products derived from microbials, plants, and other biological entities. In the developed, industrial countries, primarily in Western Europe and the United States, biopesticides are receiving more practical attention, smce they are viewed as a means to reduce the load of synthetic chemical pes- tides m an effort to provide for safer foods and a cleaner environment. In the developing countries, biopesticides are viewed as having the potential to - ploit natvte resources to produce crop protection agents that would replace imported chemical pesticides and conserve much-needed hard

The community of natural enemies that inhabits agroecosystems is complex mainly due to multiple trophic interactions established among them and their target prey/hosts. Several factors can influence the efficiency of natural enemies as biological control agents, such as the occurrence of preferred food items, supplementary food resources, shelters, agricultural practices or landscapes. In this book, scientists present recent studies in regards to the identification, protection strategies and impacts of agricultural practices on important groups of natural enemies. This core focus includes specific studies on predatory species (e.g., mites, spiders, anthocorids, nabids, carabids, and coccinellids) as well as parasitoid species (hymenopterans). The different chapters present new approaches towards the conservation of natural enemies in agroecosystems, and discuss the effects of climate change and agricultural practices on biodiversity, life history and movement of natural enemies.

Their natural enemies largely determine the population size and dynamic behavior of many plant-eating insects. Any reduction in enemy number can result in an insect outbreak. Applied biological control is thus one strategy for restoring functional biodiversity in many agroecosystems. Predators and Parasitoids addresses the role of natural enemies i

Sound formulation is a vital aspect of microbial products used to protect plants from pests and diseases and to improve plant performance. Formulation of Microbial Biopesticides is an in-depth treatment of this vitally important subject. Written by experts and carefully edited, this important title brings together a huge wealth of information for the first time within the covers of one book. The book is broadly divided into five sections, covering principles of formulation, organisms with peroral and contact modes of action, organisms with the power of search, and future trends. Each section contains comprehensive chapters written by internationally acknowledged experts in the areas covered; the book also includes three very useful appendices, cataloguing formulation additives, spray application criteria and terminology. This outstanding book is a vitally important reference work for anyone involved in the formulation of microbial biopesticides and should find a place on the shelves of agriculture and plant scientists, microbiologists and entomologists working in academic and commercial agrochemical situations, and in the libraries of all research establishments and companies where this exciting subject is researched, studied or taught.

This review of literature includes an introduction on the origin of the olive tree and lists 116 species of insects and 30 species of mites known to infest it. It treats the geographical distribution, host plants, feeding habits, voltinism and seasonal history of 34 species of phytophagous insects as well as of 7 species of mites.

## PUBLIC HEALTH PEST CONTROL

CRC Press

With an ever-increasing human population, the demand placed upon the agriculture sector to supply more food is one of the greatest challenges for the agrarian community. In order to meet this challenge, environmentally unfriendly agroch- icals have played a key role in the green revolution and are even today commonly recommended to circumvent nutrient de?iciencies of the soils. The use of ag- chemicals is, though, a major factor for improvement of plant production; it causes a profound deteriorating effect on soil health (soil fertility) and in turn negatively affects the productivity and sustainability of crops. Concern over disturbance to the microbial diversity and

consequently soil fertility (as these microbes are involved in biogeochemical processes), as well as economic constraints, have prompted fundamental and applied research to look for new agrobiotechnologies that can ensure competitive yields by providing sufficiently not only essential nutrients to the plants but also help to protect the health of soils by mitigating the toxic effects of certain pollutants. In this regard, the role of naturally abundant yet functionally fully unexplored microorganisms such as biofertilizers assume a special significance in the context of supplementing plant nutrients, cost and environmental impact under both conventional practices and derelict environments. Therefore, current developments in sustainability involve a rational exploitation of soil microbial communities and the use of inexpensive, though less bio-available, sources of plant nutrients, which may be made available to plants by microbially-mediated processes.

**Microbial Strategies for Crop Improvement** Francisco Sanchez-Bayo

*Ecological Impacts of Toxic Chemicals* presents a comprehensive, yet readable account of the known disturbances caused by all kinds of toxic chemicals on both aquatic and terrestrial ecosystems.

Topics cover the sources of toxicants, their fate and distribution through the planet, their impacts on specific ecosystems, and their remediation by natural systems. Each chapter is written by well-

known specialists in those areas, for the general public, students, and even scientists from outside this field. The book intends to raise awareness of the dangers of chemical pollution in a world dominated by industry and globalization of resources. Because the problems are widespread and far reaching, it is hoped that confronting the facts may prompt better management practices at industrial, agricultural and all levels of management, from local to governmental, so as to reduce the negative impacts of chemical contaminants on our planet.
