**Particle-induced X-ray emission | physics | Britannica** Particle Induced X Ray EmissionParticle-induced X-ray emission or proton-induced X-ray emission (PIXE) is a technique used in the determining of the elemental make-up of a material or sample. When a material is exposed to an ion beam, atomic interactions occur that give off EM radiation of wavelengths in the x-ray part of the electromagnetic spectrum specific to an element. . PIXE is a powerful yet non-destructive elemental ...Particle-induced X-ray emission - WikipediaParticle Induced X-ray Emission As a charged particle moves through a material, it loses energy primarily by exciting electrons in the atoms that it passes by. Electrons in the inner shells of the atom (predominantly the K and L shells) are given enough energy to cause them to be ejected, resulting in an unstable electron atomic configuration.Particle Induced X-ray Emission | ANSTOParticle Induced X-Ray Emission (PIXE) is the measurement of X-rays emitted from a sample due to high energy ion bombardment. Several kinds of excitation beams produce X-rays with energies characteristic of the target elements.
