Diabetes is a condition where the body is unable to regulate the amount of glucose in the blood due to lack of insulin or it is the body's inability to produce insulin. If left unchecked and uncontrolled, diabetes can lead to serious conditions including heart attack, stroke, blindness and kidney failure. Hence the patient has to constantly monitor the blood glucose level to keep it under control. Most current methods for self-blood-glucose-monitoring are invasive which require a blood sample for each test. The blood sampling can be painful and cause calluses to form. Hence Non-invasive methods are being researched upon as an alternative to invasive methods. This book describes a Non-Invasive Blood Glucose monitoring System by using Near Infrared Spectroscopy Technique. This works by projecting Near Infrared radiation on the finger of a subject and sensing the resultant radiation after absorbance. Immediately after this measurement, an invasive reference reading is taken. By

doing this the glucose levels are attributed to the obtained voltage levels which are standardized through a series of experiments and analysis. A suitable and accurate algorithm is hence formulated

We live in a century of technological revolution and the birth of artificial intelligence. Like every other sphere of our life, diabetes-related technology is moving forward with lightning speed. New and improved insulin administration devices, increased capacity for monitoring one's blood glucose levels, and the ability to communicate directly with the device supplying insulin as well as with the patient and his/her healthcare provider have changed diabetes therapy forever. The problem is that diabetes-related technology is moving ahead much faster than physicians and other healthcare professionals can incorporate these

advances into our practices. Diabetes Technology will consist of three parts: Part I addresses the clinical science of diabetes pumps, continuous glucose monitoring and communication technology with numerous practical aspects. Part III offers personal stories of healthcare providers who treat their own diabetes with modern diabetes technology. In particular, they will address how and why they decided to use this technology and the positive and negative aspects of their decision.
