A hurricane is a tropical storm with winds that have reached a constant speed of 74 miles per hour or more. Hurricane winds blow in a large spiral around a relative calm centre known as the "eye." The "eye" is generally 20 to 30 miles wide, and the storm may extend outward 400 miles. As a hurricane approaches, the skies will begin to darken and winds will grow in strength. As a hurricane nears land, it can bring torrential rains, high winds, and storm surges. A single hurricane can last for more than 2 weeks over open waters and can run a path across the entire length of the eastern seaboard. August and September are peak months during the hurricane season that lasts from 1 June to 30 November. This book presents the facts and history of hurricanes.

Climate may be defined as the synthesis of long-term atmospheric conditions characteristic of a particular place. Consequently, the study of climate relies on sustained records of daily values. However, both location and equipment are variables and precise measurements may not be possible. There are occasions when an estimate rather than a measurement is necessary, as when gauging the

unrecorded past or future. The value of applied climatology - the study of the impact of climate - lies in the analysis of measurements and estimates within the context of change. Climate Data and Resources provides a review of the theory and practice underlying current climatic research. The author describes the nature of atmospheric resources - solar radiation, wind and precipitation - and describes the specification, obtaining and treatment of climate data. Fully referenced and illustrated, Climate Data and Resources should prove a valuable resource to all those interested in the collection and analysis of climatic data.
