This book presents a selection of the best papers from the HEaRT 2013 conference, held in Cosenza, Italy, which provided a valuable forum for engineers and architects, researchers and educators to exchange views and findings concerning the technological history, construction features and seismic behavior of historical timber-framed walls in the Mediterranean countries. The topics covered are wide ranging and include historical aspects and examples of the use of timber-framed construction systems in response to earthquakes, such as the gaiola system in Portugal and the Bourbon system in southern Italy;

interpretation of the response of timber-framed walls to seismic actions based on calculations and experimental tests; assessment of the effectiveness of repair and strengthening techniques, e.g., using aramid fiber wires or sheets; and modelling analyses. In addition, on the basis of case studies, a methodology is presented that is applicable to diagnosis, strengthening and improvement of seismic performance and is compatible with modern theoretical principles and conservation criteria. It is hoped that, by contributing to the knowledge of this construction technique, the book will help to promote conservation of this important component of Europe's architectural heritage.

Countryside Books (GB) Second Edition
A Timber Framer's Workshop Joseph Benton
 "Their houses are some Built of timber": The Colonial Timber Frame Houses of Fenwick's Colony, New Jersey" analyzes the material culture of timber frame houses in southwestern New Jersey for the first time, thereby filling a gap in the literature of

traditional timber frame building in the American colonial period and in the popular imagination of the colonial architectural landscape of Fenwick's Colony in the province of West New Jersey. Despite a higher percentage of brick houses in eighteenth-century Salem County than in other areas of the region, houses were predominately of wood, reflecting the long European heritage of building in timber. In original documentation of three timber frame houses in Salem County, two different framing traditions emerge--a simplified English box frame, and a New Netherlandic H-frame. Three Cumberland County house frames from circa 1700 documented by others revealed a heavier timber framing tradition more typical of New England houses. These three distinct framing traditions can be connected to the diverse cultural groups that settled sub-regions of Fenwick's Colony in the late seventeenth-century--Quaker English and other groups who immigrated from the British Isles and the American south, an ethnic mix of people descended from settlers

of New Netherland and New Sweden, and colonists from New England, Long Island and the province of East Jersey. The framing traditions uncovered are not new to American colonial building; they bear resemblance to traditions found in the Chesapeake Bay region, Netherlandic-settled areas of the Hudson Valley, and New England. These findings point to the lack of a uniform building tradition in the colonial period, and hence characterize Fenwick's Colony as a culturally heterogeneous sub-region of the mid-Atlantic cultural hearth. By looking at frames, this thesis contributes to the understanding of its early settlement, the diffusion of building ideas, and to the significance of the heritage of timber frame building in Salem and Cumberland Counties. As the beginning of vernacular architectural study of timber frame houses as artifacts, it points the way to further study and preservation planning tasks for this property type.

Hand Hewn is a gorgeous celebration of the traditions and artistry of timber-frame building, a 7,000-year-old craft that holds an enduring attraction for its simple elegance and resilience. Internationally renowned timber-frame architect and craftsman Jack A. Sobon offers a fascinating look at how the natural, organic forms of trees become the framework for a home, with profiles of the classic tools he uses to hand hew and shape each timber, and explanations of the engineering of the wooden joinery that connects the timbers without a single nail. Inspiring photos of Sobon's original interior home designs, as well as historical examples of long-lived structures in Europe and North America, make this a compelling tribute to the lasting value of artisanal craftsmanship and a thoughtful, deliberate approach to designing buildings.

All those of us without traditional skills need to know to build with timber framing. Many natural building methods rely upon the use of post and beam frame structures that are then in-filled with straw, cob, cordwood, or more conventional wall materials. But traditional timber framing employs the use of finely crafted jointing and wooden pegs, requiring a high degree of craftsmanship and training, as well as much time and expense.

However, there is another way... Timber Framing for the Rest of Us describes

the timber framing methods used by most contractors, farmers, and owner-builders, methods that use modern metal fasteners, special screws, and common sense building principles to accomplish the same goal in much less time. And while there are many good books on traditional timber framing, this is the first to describe in depth these more common fastening methods. The book includes everything an owner-builder needs to know about building strong and beautiful structural frames from heavy timbers, including: the historical background

of timber framing crucial design and structural considerations: procuring timbers—including different woods, and recycled materials; foundations, roofs, and in-filling considerations; the common fasteners. A detailed case study of a timber frame project from start to finish completes this practical and comprehensive guide, along with a useful appendix of span tables and a bibliography. Highly illustrated, this book enables 'the rest of us' to build like the professionals and will appeal to owner-builders, contractors and architects alike.
