 Quantum theory describes that matter, and light consists of minute particles that have properties of waves that are associated with them. Light consists of particles known as photons and matter are made up of particles known as protons, electrons, and neutrons. Let's understand how the light behaves as a particle and as a wave.
 Quantum Theory of Light Wave-Particle Duality of Light Planck's Constant and the Speed of Light. When solving numerical problems in the Quantum Theory of Light it is useful to note that the product of Planck's constant $h = 6.6261 \times 10^{-34} \text{ J s}$ (1) and the speed of light $c = 2.9979 \times 10^8 \text{ m s}^{-1}$ (2) is $hc = 1239.8 \text{ eV nm} = 1239.8 \text{ keV pm} = 1239.8 \text{ MeV fm}$ (3) where $\text{eV} = 1.6022 \times 10^{-19} \text{ J}$ (4) Wien's Displacement Law Solved Problems in the Quantum Theory of Light
 Quantum theory of light By the end of the 19th century, the battle over the nature of light as a wave or a collection of particles seemed over. James Clerk Maxwell's synthesis of

electric, magnetic, and optical phenomena and the discovery by Heinrich Hertz of electromagnetic waves were theoretical and experimental triumphs of the first order. Light - Quantum theory of light | Britannica
 Quantum Light. Light is normally thought of as an electromagnetic wave at optical frequencies. What we call light can reasonably be extended to the near infrared and ultraviolet parts of the spectrum, all of which satisfy Maxwell's equations for the electromagnetic field. We can use these to write down a wave equation for the electric and magnetic fields whose solution is waves which travel at speed c - the speed of light and one of the fundamental constants of the universe.

 Wave-Particle Duality of Light. Quantum theory tells us that both light and matter consists of tiny particles which have wavelike properties associated with them. Light is composed of particles called photons, and matter is composed of particles called electrons, protons, neutrons. It's only when the mass of a particle gets small enough that its wavelike properties show up.
 Quantum Theory of Light | Grandinetti Group It is denoted by 'c'. Velocity of light $= c = 3.0 \times 10^8 \text{ m.sec}^{-1} = 3.0 \times 10^{10} \text{ cm.sec}^{-1}$. Note: For all types of

electromagnetic radiations, the velocity is a constant value. The relation between velocity (c), wavelength (λ) and frequency (ν) can be given by following equation. $\text{velocity} = \text{frequency} \times \text{wavelength}$.

LIGHT & QUANTUM THEORY
 - Adi Chemistry Einstein proposed a quantum theory of light to solve the difficulty and then he realised that Planck's theory made implicit use of the light quantum hypothesis. By 1906 Einstein had correctly guessed that energy changes occur in a quantum material oscillator in changes in jumps which are multiples of $h\nu$ where h is Planck's reduced constant and ν is the frequency.

Quantum mechanics history - MacTutor History of Mathematics
 Quantum mechanics, science dealing with the behaviour of matter and light on the atomic and subatomic scale. It attempts to describe and account for the properties of molecules and atoms and their constituents— electrons, protons, neutrons, and other more esoteric particles such as quarks and gluons.

quantum mechanics | Definition, Development, & Equations ...
 Quantum mechanics arose gradually, from theories to explain observations which could not be reconciled with classical physics, such as Max Planck's solution in 1900 to the black-body radiation problem, and the correspondence between energy and frequency in Albert Einstein's 1905 paper which explained the photoelectric effect.
